**Assisting Lecture 7 (Java Restful WS in
Google App Engine)**

Μύρων Παπαδάκης
Τμήμα Επιστήμης Υπολογιστών

CS-592: Introduction Service Networks

Spring 2015

Assisting Lecture: Java Restful Web Services in
the Google App Engine

Myron Papadakis (myrpap@gmail.com)

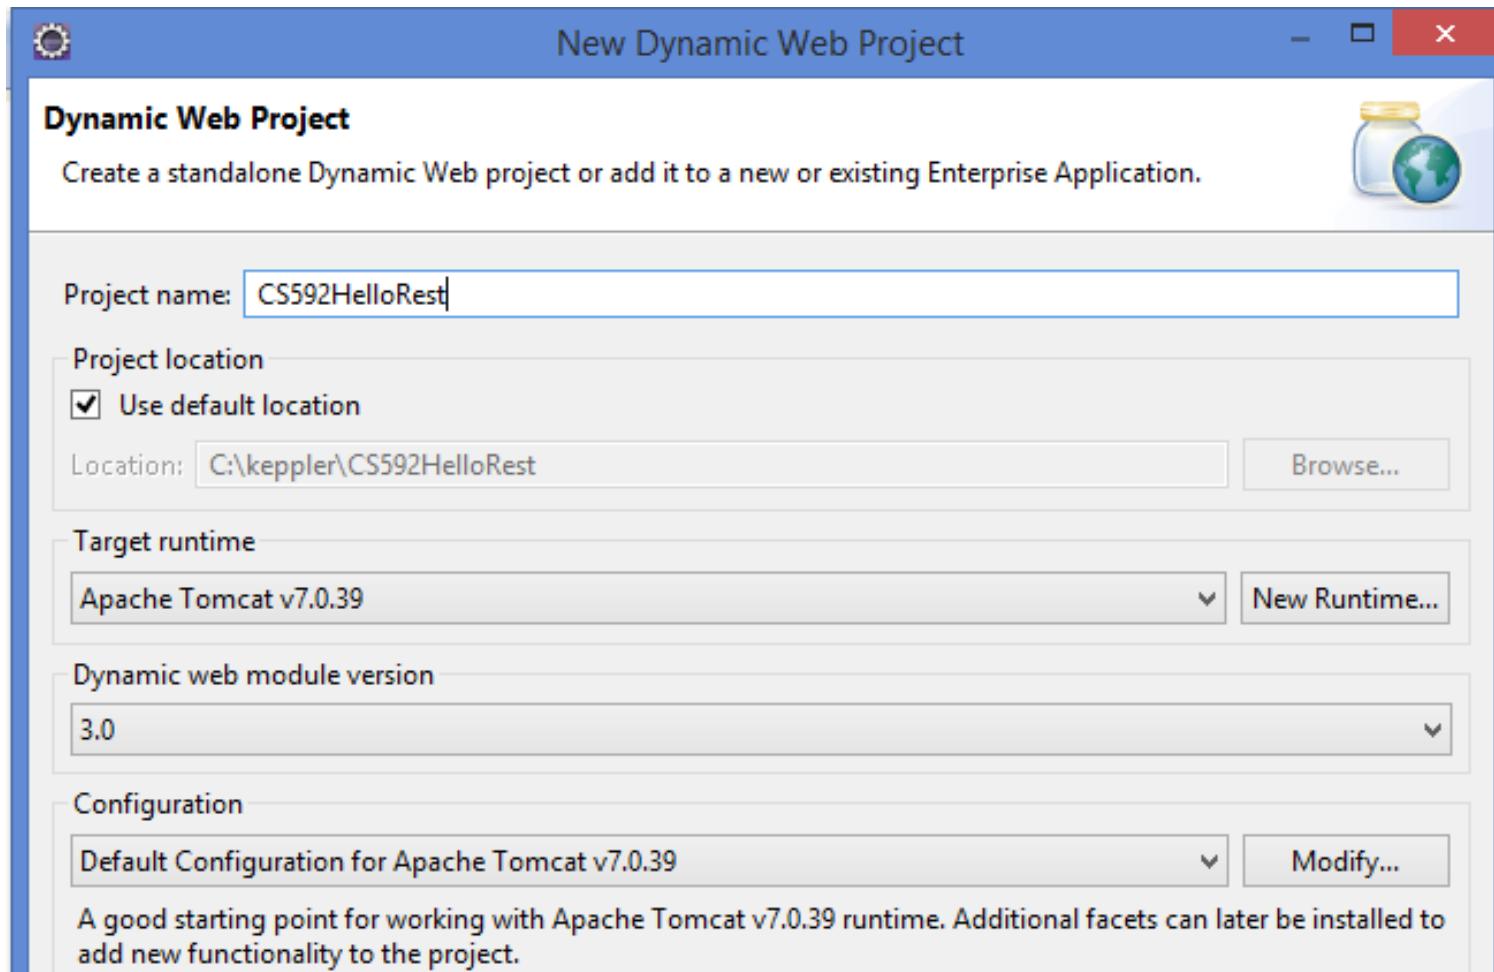

Creating and Deploying Web applications in Google App Engine

Example 1: Hello World Example using JAX-RS

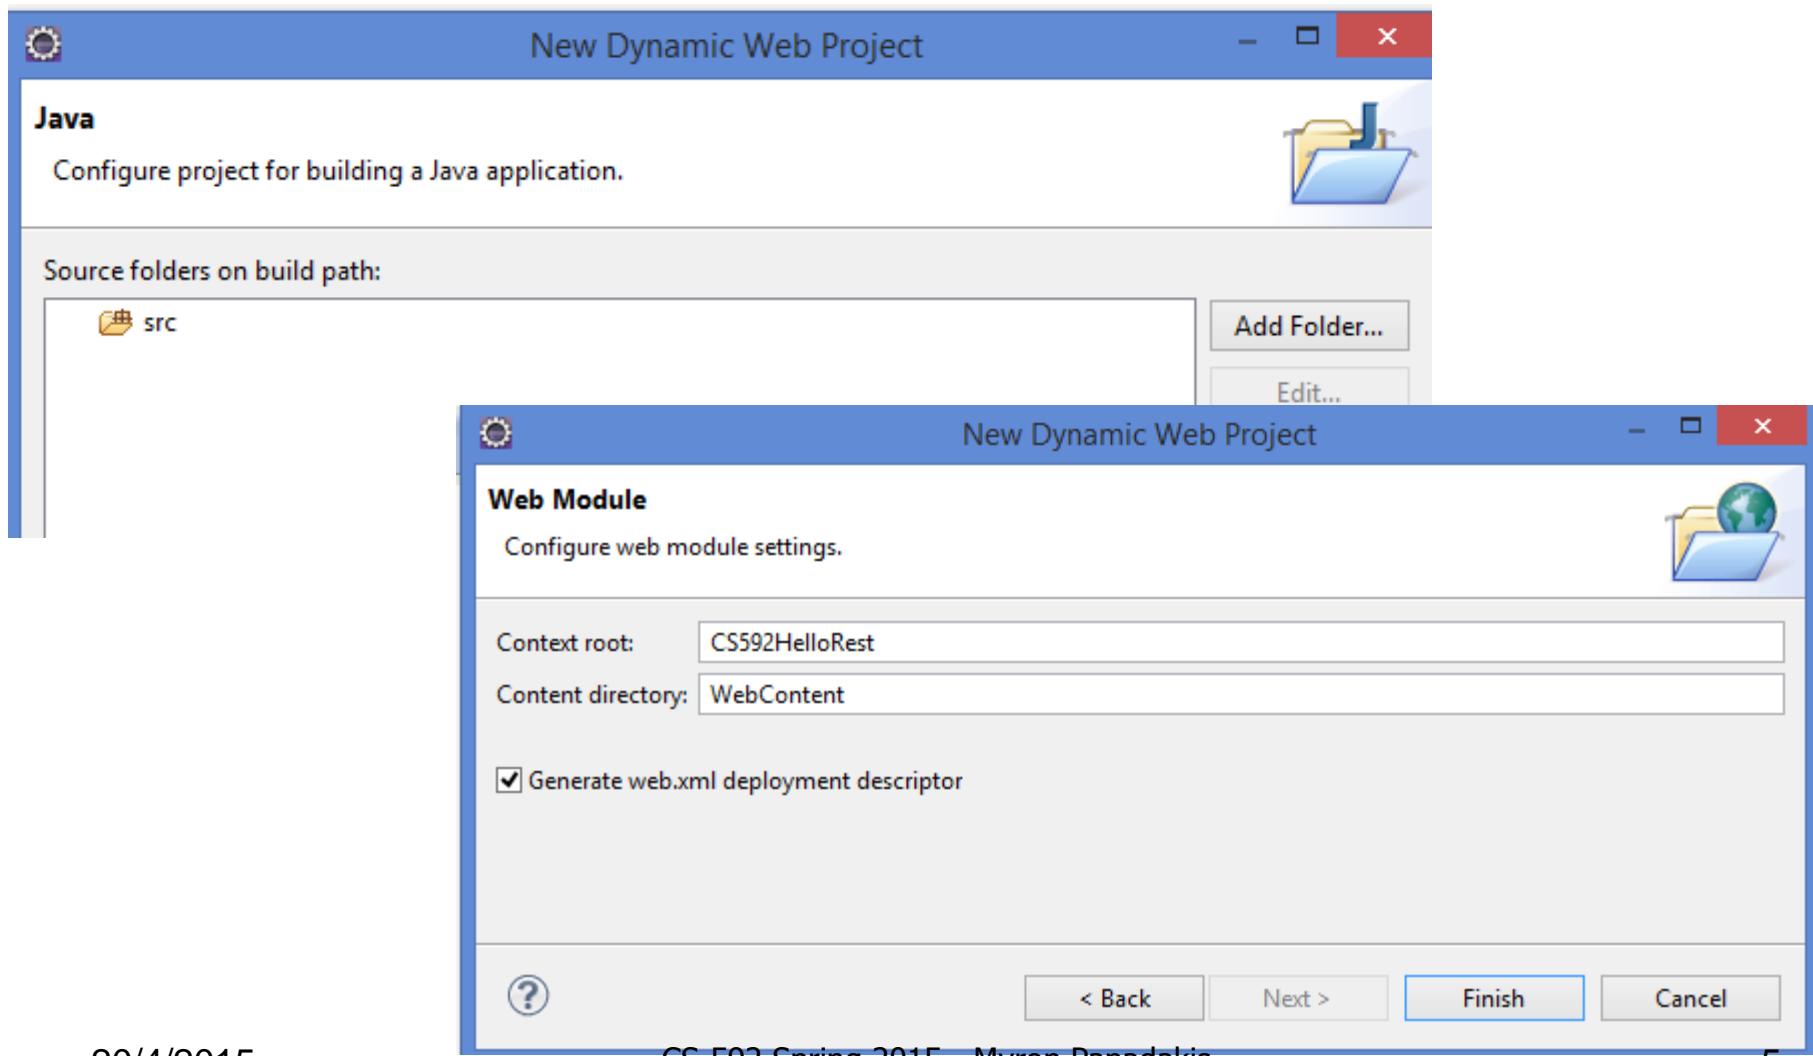

Download Jersey

- Download the Jersey distribution as zip file from the [Jersey download site](#).
 - jaxrs-ri-2.16 or jaxrs-ri-2.17.zip
 - It is a collection of jars..
- The zip contains the Jersey implementation JAR and its core dependencies.
 - It does not provide dependencies for third party JARs beyond those for JSON support and JavaDoc.
 - This means that in many cases we have to add some jars from external parties....(i.e. jaxb and gson)

Eclipse > Create new Dynamic Web Project

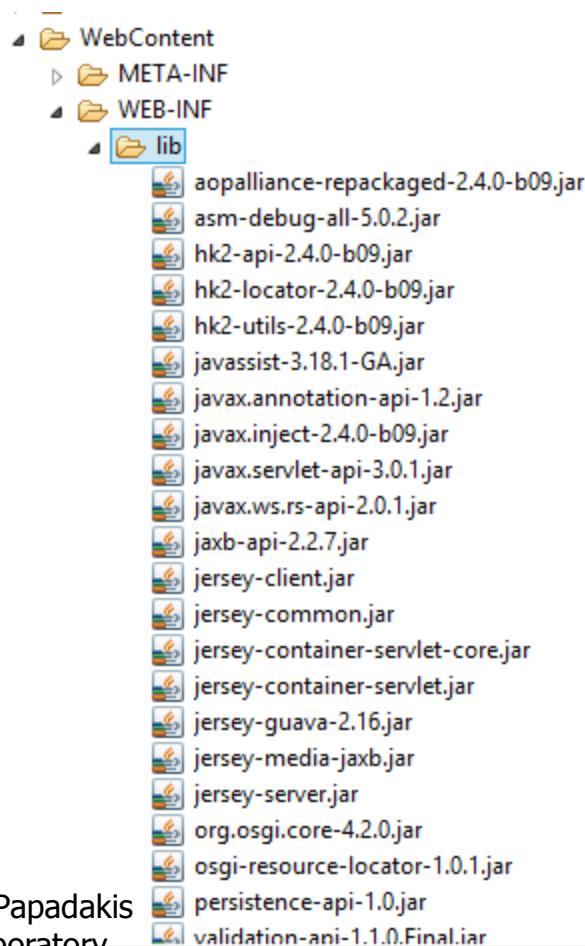

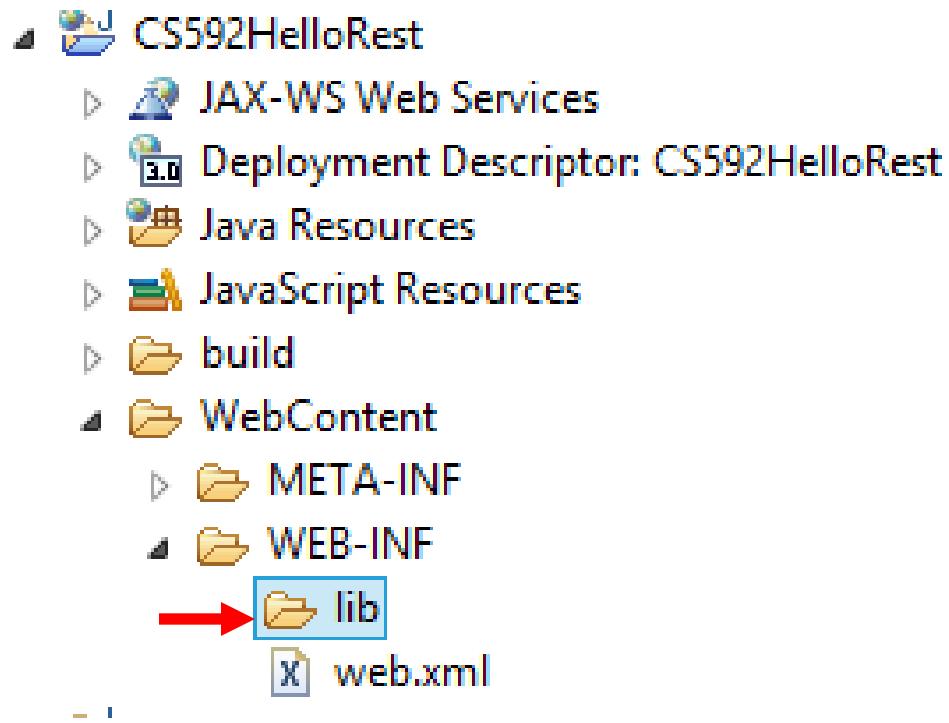

Eclipse > Create new Dynamic Web Project

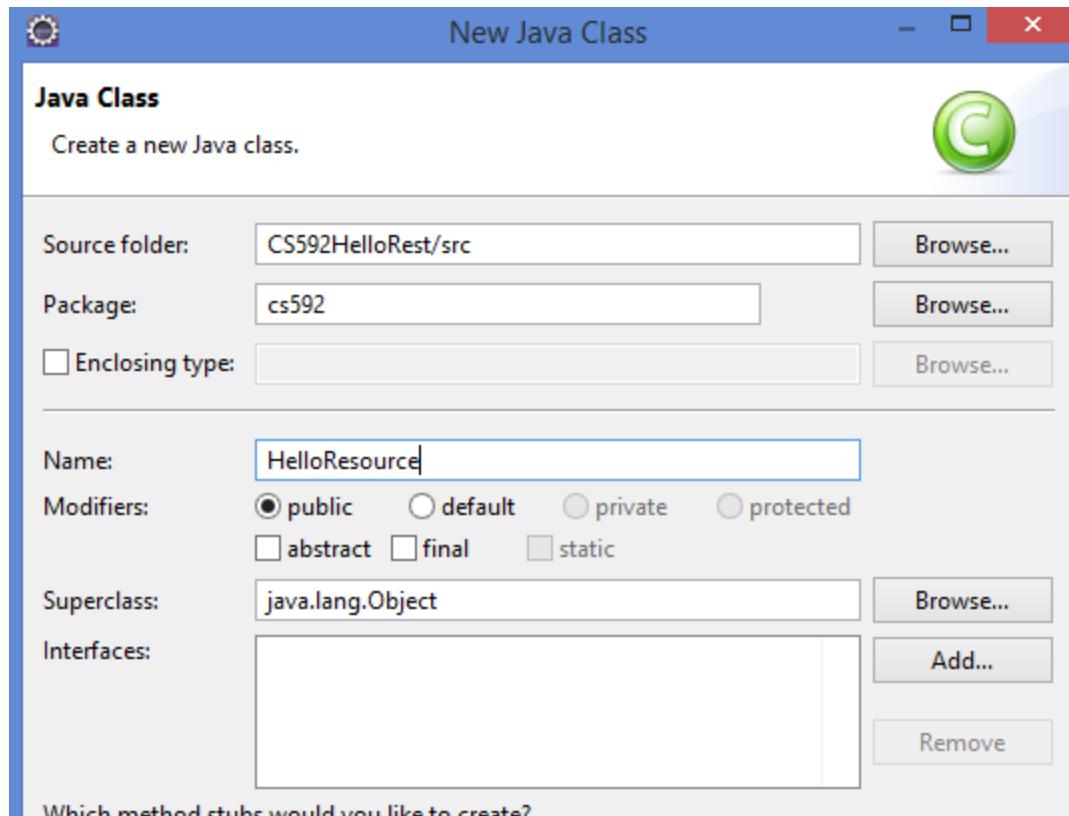

Jersey Jar Copy

- Copy all JARs from your Jersey download into the WEB-INF/lib folder.

Create New Class (Resource)

Create New Class (Resource)

```
package cs592;

import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.Produces;
import javax.ws.rs.core.Response;
import javax.ws.rsPathParam;
import javax.ws.rsQueryParam;
import javax.ws.rsFormParam;
import javax.ws.rsPOST;
@Path("/hello")
public class HelloResource {
```

Create New Class (Resource)

```
@GET  
@Path("/query")  
@Produces("text/html")  
public String getGreetingQueryParam(@QueryParam("name")  
String name) {  
    return "<html><body><h1>Hello " + name +  
" !</h1></body></html>";  
}  
  
@GET  
@Path("{name}")  
@Produces("text/html")  
public String getGreetingParam(@PathParam("name") String  
name) {  
    return "<html><body><h1>Hello " + name +  
" !</h1></body></html>";  
}
```

Create New Class (Resource)

```
/*
 * Html File should be located to the WebContent
folder
 * Invoke: http://localhost:8080/HelloRest/form.html
 */
@POST
@Path("/form")
public Response sayHiToUser(
    @FormParam("fname") String fname,
    @FormParam("lname") String lname) {

    String output = "<html><body><h1>Hello " + fname +
" "+lname+"!</h1></body></html>";
}

return Response.status(200).entity(output).build();
```

Create New HTML File

The screenshot shows the Eclipse IDE interface. On the left, the Project Explorer view displays the project structure:

- BookExampleAppEngine
- CS592HelloRest
 - JAX-WS Web Services
 - Deployment Descriptor: CS592HelloRest
- Java Resources
 - src
 - cs592
 - Libraries
- JavaScript Resources
- build
- WebContent
 - META-INF
 - WEB-INF
 - lib
 - web.xml
- form.html

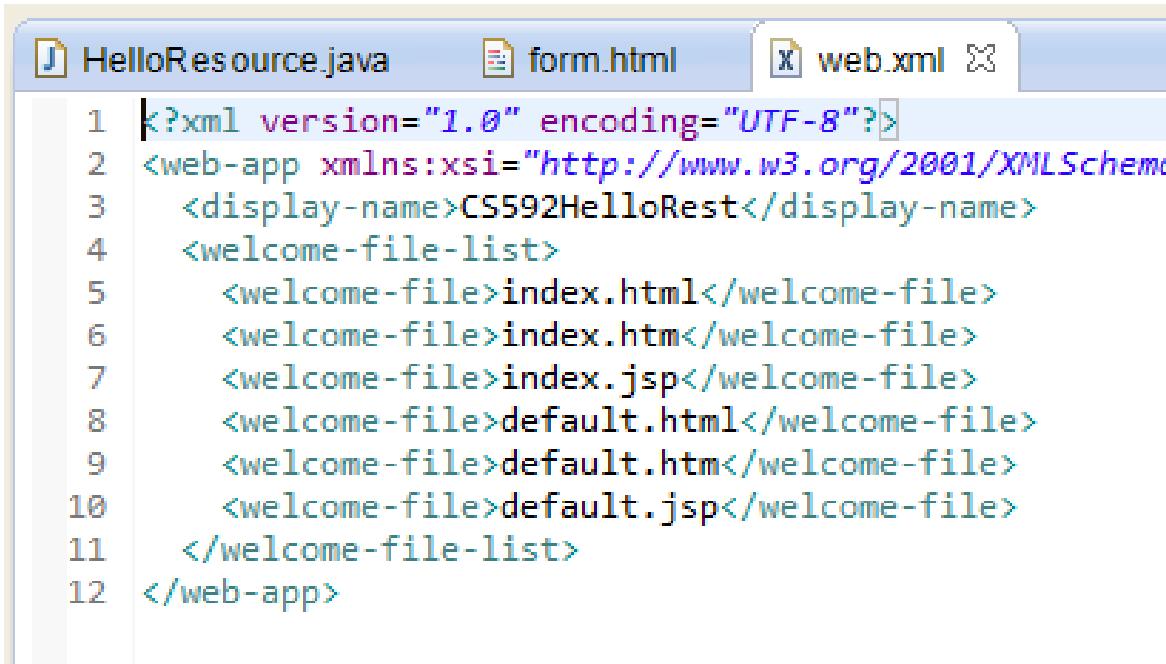

In the center-right area, there is a code editor window. The active tab is "HelloResource.java". Below it, the tabs show "form.html" and "web.xml". The URL "http://localhost:8080/CS" is visible at the top right of the editor. The code in "form.html" is as follows:

```
1 <!DOCTYPE html>
2 <html>
3 <body>
4     <h1>JAX-RS @FormQuery Testing</h1>
5
6     <form action="/CS592HelloRest/rest/hello/form" method="post">
7         <p>
8             FirstName : <input type="text" name="Lname" />
9         </p>
10        <p>
11            LastName : <input type="text" name="fname" />
12        </p>
13        <input type="submit" value="Submit" />
14    </form>
15
16 </body>
17 </html>
```

Define Jersey Servlet dispatcher

> web.xml

- Default generated web.xml should look like the following
- We have to modify it to deploy it to Tomcat

The screenshot shows a code editor window with three tabs at the top: "HelloResource.java", "form.html", and "web.xml". The "web.xml" tab is active and selected. The code in the editor is a standard Java XML configuration file for a web application:

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
3   <display-name>CS592HelloRest</display-name>
4   <welcome-file-list>
5     <welcome-file>index.html</welcome-file>
6     <welcome-file>index.htm</welcome-file>
7     <welcome-file>index.jsp</welcome-file>
8     <welcome-file>default.html</welcome-file>
9     <welcome-file>default.htm</welcome-file>
10    <welcome-file>default.jsp</welcome-file>
11  </welcome-file-list>
12 </web-app>
```

Define Jersey Servlet dispatcher

> web.xml

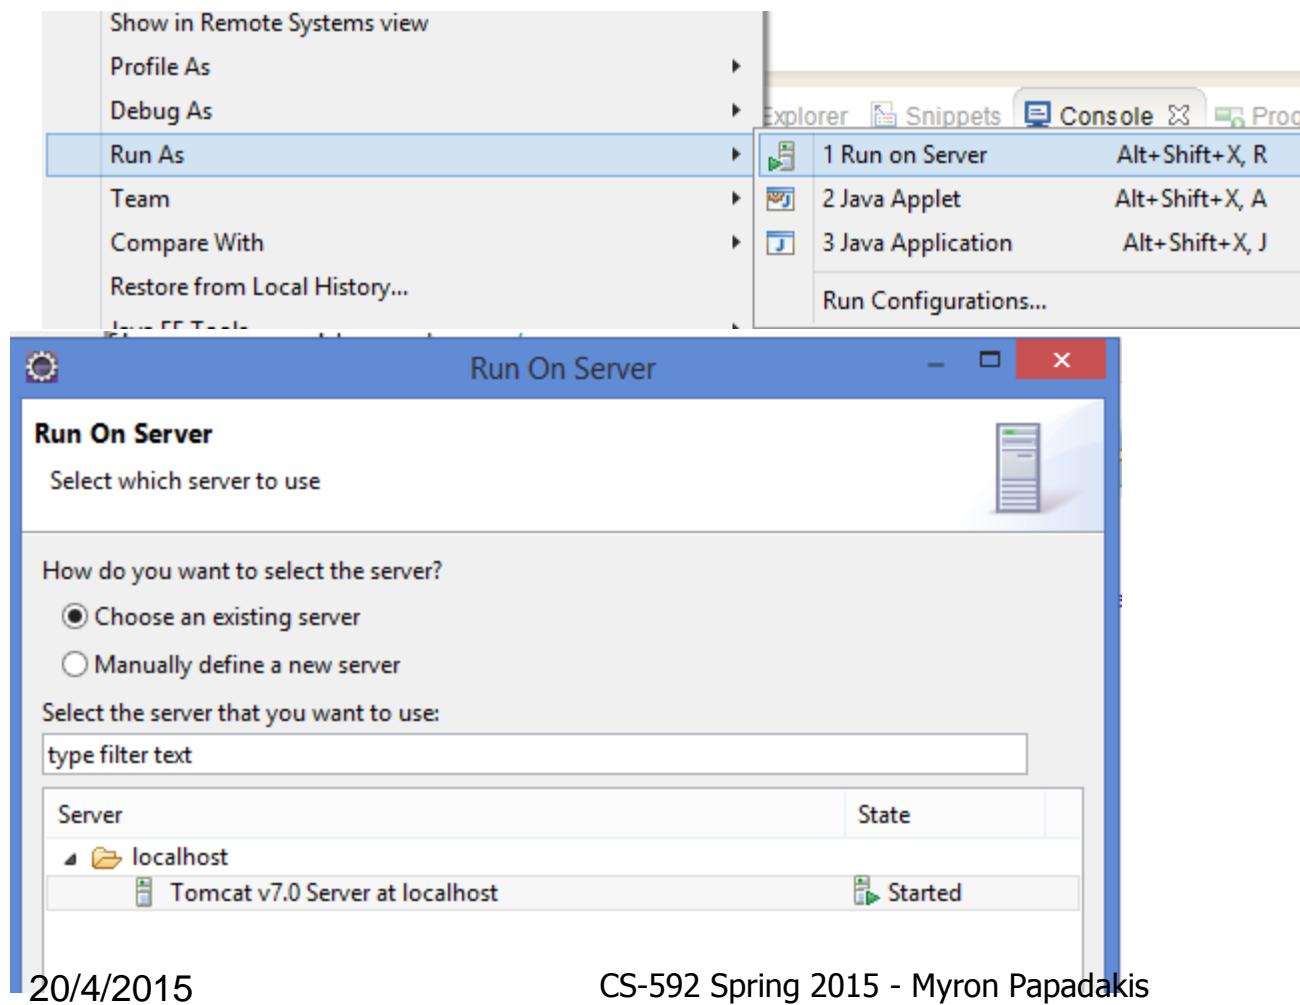

- You need to register Jersey as the servlet dispatcher for REST requests.
- The complete path to a resource is based on the base URL and the @PAtH annotation in your class.
- **http://your_domain:port/display-name/url-pattern/path_from_rest_class**

The screenshot shows a code editor with three tabs: HelloResource.java, form.html, and web.xml. The web.xml tab is active and displays the following XML configuration:

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns="http://java.sun.com,
3   <display-name>CS592HelloRest</display-name>
4 <servlet>
5   <servlet-name>CS592HelloRest</servlet-name>
6   <servlet-class>org.glassfish.jersey.servlet.ServletContainer</servlet-class>
7   <!-- Register resources and providers under com.vogella.jersey.first package. -->
8 <init-param>
9   <param-name>jersey.config.server.provider.packages</param-name>
10  <param-value>cs592</param-value>
11  </init-param>
12  <load-on-startup>1</load-on-startup>
13 </servlet>
14 <servlet-mapping>
15   <servlet-name>CS592HelloRest</servlet-name>
16   <url-pattern>/rest/*</url-pattern>
17 </servlet-mapping>
18 </web-app>
```

The URL pattern '/rest/*' is highlighted in blue, indicating it is the current selection or being edited.

Running in Tomcat

Running in Tomcat

The screenshot shows two windows related to running a Spring application in Tomcat.

Run On Server Dialog:

- Title Bar:** Run On Server
- Section:** Add and Remove
- Text:** Modify the resources that are configured on the server
- Available:** BookExample
- Configured:** CS592HelloRest, HelloRest
- Buttons:** Add > (disabled), < Remove

Server Confirmation Dialog:

- Title Bar:** Server
- Text:** The server may need be restarted. Do you want to restart the server?
- Buttons:** OK, Cancel
- Options:** Radio button for "Restart server" (selected), radio button for "Continue without restarting", checkbox for "Remember my decision".

Page Footer:

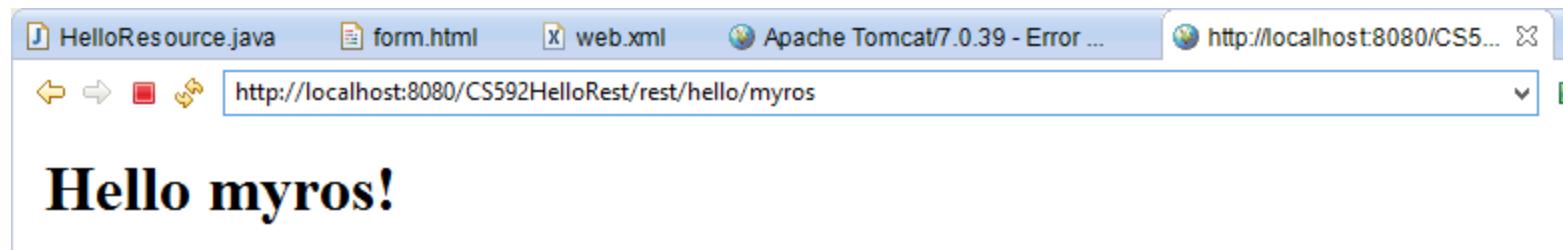

- 20/4/2015
- CS-592 Spring 2015 - Myron Papadakis
- Transformation Systems Laboratory
- 15

Running in Tomcat

- Don't worry if you see the following page
- Remember
- **`http://your_domain:port/display-name/url-pattern/path_from_rest_class`**

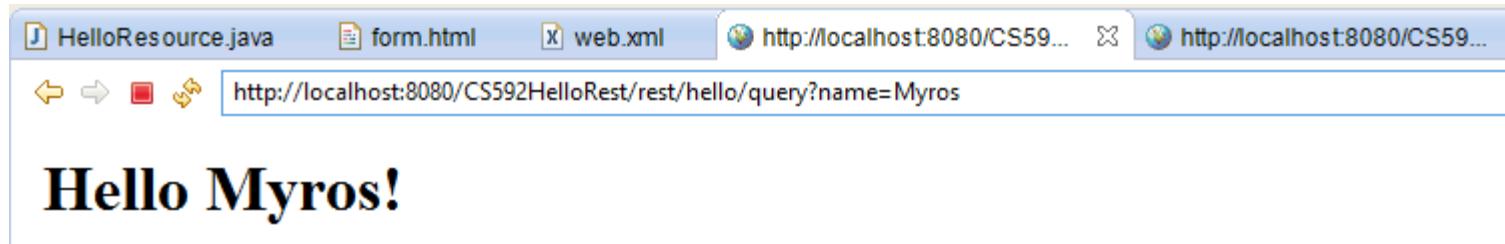

Running in Tomcat > PathParam

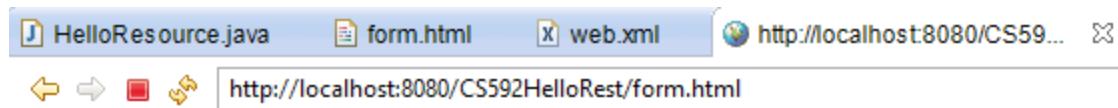

```
@GET  
@Path("{name}")  
@Produces("text/html")  
public String getGreetingParam(@PathParam("name") String name) {  
    return "<html><body><h1>Hello " + name + "</h1></body></html>";  
}
```

Running in Tomcat > QueryParam

```
@GET  
@Path("/query")  
@Produces("text/html")  
public String getGreetingQueryParam(@QueryParam("name") String name) {  
    return "<html><body><h1>Hello " + name + "!</h1></body></html>";  
}
```

Running in Tomcat > FormParam

JAX-RS @FormQuery Testing

FirstName :

LastName : X

```
/*
 * Html File should be located to the WebContent folder
 * Invoke: http://localhost:8080/HelloRest/form.html
 */
@POST
@Path("/form")
public Response sayHiToUser(
    @FormParam("fname") String fname,
    @FormParam("lname") String lname) {

    String output = "<html><body><h1>Hello " + fname + " " + lname + "</h1></body></html>";

    return Response.status(200).entity(output).build();
}
```

Google App Engine

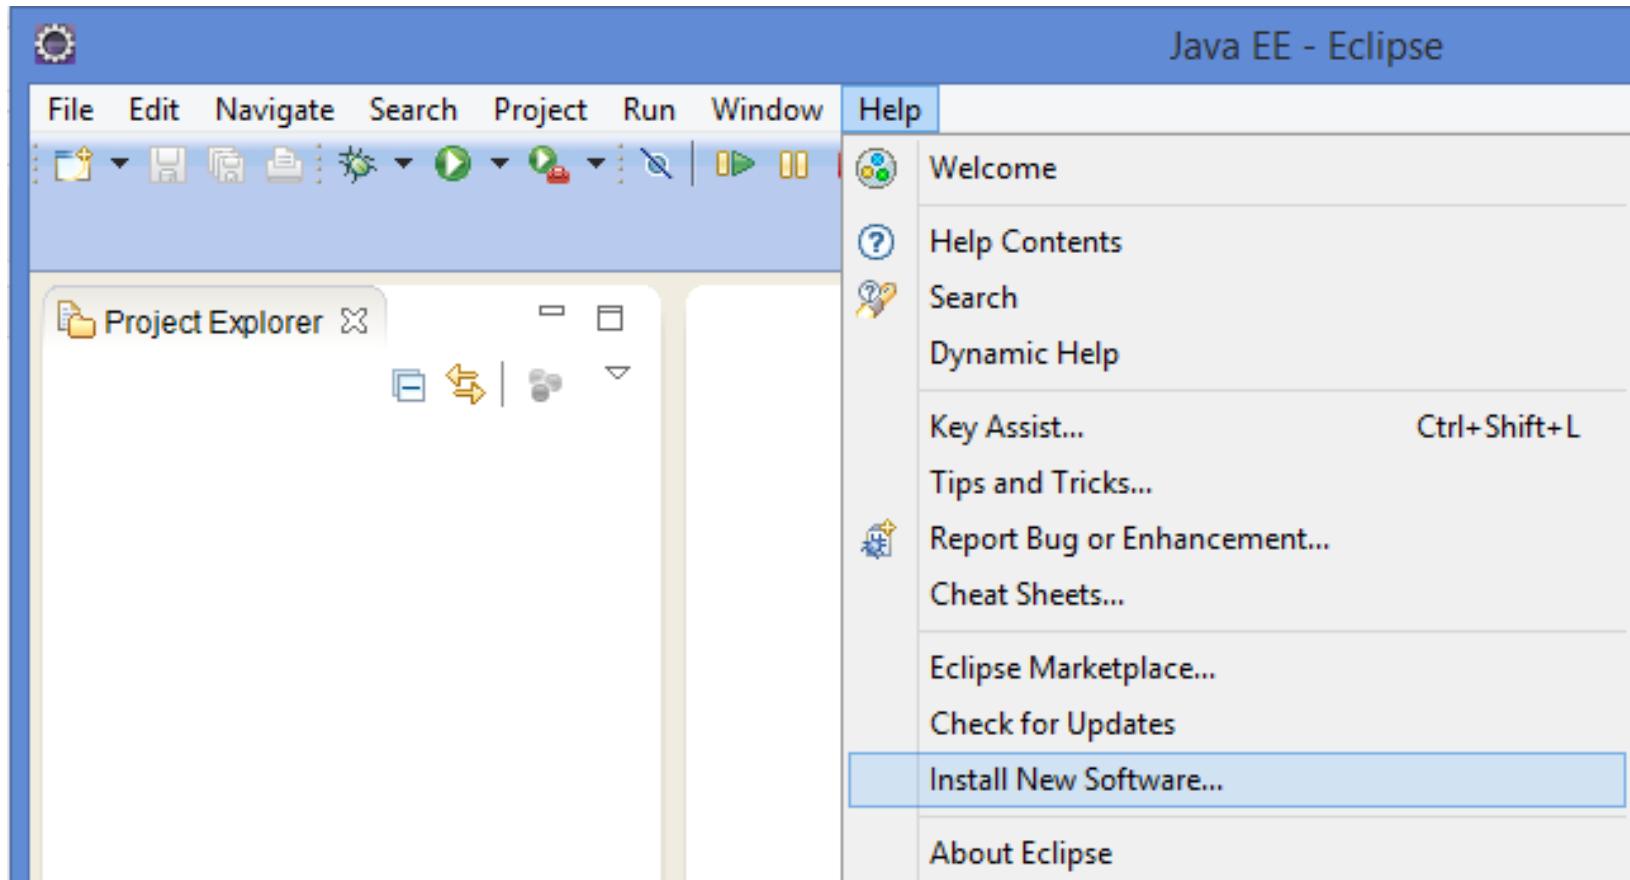

Note

- Unfortunately for Netbeans the google app engine plugin does not work smoothly.
- There are a lot of conflicts with libraries and it is very frustrating
- <https://code.google.com/p/nb-gaelyk-plugin/downloads/list>

Google Plugin for Eclipse

- <https://developers.google.com/eclipse/docs/download>
- Complete Instructions are given here (for example for Kepler)
 - <https://developers.google.com/eclipse/docs/install-eclipse-4.3>
- Install the plugin and Restart the Ide
- <https://developers.google.com/eclipse/docs/signin>

Google Plugin for Eclipse

Google Plugin for Eclipse

The screenshot shows two overlapping windows from the Eclipse IDE.

The top window is titled "Install" and displays the "Available Software" interface. It includes a toolbar with a gear icon, a title bar with "Install", and a message "Select a site or enter the location of a site." Below this is a search bar labeled "Work with: type or select a site" with an "Add..." button. A note says "Find more software by working with the ['Available Software Sites'](#) preferences." A "type filter text" input field is present. A table lists software packages under "Name" and "Version". A message indicates "There is no site selected." Buttons for "Select All" and "Deselect All" are at the bottom. A "Details" link is visible on the left.

The bottom window is titled "Add Repository" and allows adding a new software source. It has fields for "Name" (set to "Google") and "Location" (set to <https://dl.google.com/eclipse/plugin/4.3>). It includes "Local..." and "Archive..." buttons. At the bottom are "OK" and "Cancel" buttons, along with a help icon.

At the bottom of the slide, there is footer text: "CS-592 Spring 2015 - Myron Papadakis Transformation Systems Laboratory".

Page navigation elements "20/4/2015" and "24" are located at the bottom right.

Google Plugin for Eclipse

Google Plugin for Eclipse

Google Plugin for Eclipse

Google App Engine Java Support

Java:

- App Engine runs JAVA apps on a JAVA 7 virtual machine (currently supports JAVA 6 as well).
 - Uses JAVA Servlet standard for web applications:
 - WAR (Web Applications ARchive) directory structure.
 - Servlet classes
 - Java Server Pages (JSP)
 - Static and data files
 - Deployment descriptor (web.xml)
 - Other configuration files
 - Getting started :

<https://developers.google.com/appengine/docs/java/gettingstarted/>

Checking Installation

The screenshot shows the Eclipse IDE's Preferences dialog with the title "Preferences" at the top. On the left, there is a tree view under the heading "type filter text" with the following items:

- General
- Ant
- Data Management
- Google
 - App Engine
 - Errors/Warnings
 - Speed Tracer
 - Web Toolkit
- Help
- Install/Update
- Java
- Java EE
- Java Persistence
- JavaScript
- Maven
- Mylyn
- Platform
- UI

The "App Engine" node is selected and highlighted in blue. The main pane is titled "App Engine" and contains the following text:

Add, remove or download SDKs.
By default, the checked SDK is added to the build path of newly created projects.

SDKs:

Name	Version	Location
App Engine	1.9.18	C:\Users\Myron\Desktop\kepler\eclipse\plugins\com.google.appengine.eclipse.sdkbundle_1.9.18.v201207101800

On the right side of the dialog, there are three buttons: "Add...", "Remove", and "Download...".

Eclipse Steps

- Create a new application with a certain id in the google app engine.
- Create a new Google Web Application Project
- Configure build path
- Copy to lib all the jersey jars...
- Change web.xml
- Check and fill in the application id in the appengine-web.xml
- There is no need to have Apache Tomcat or Glassfish installed!

Google App Engine

Hello Example

Google app engine > create app

https://appengine.google.com/start/createapp

Google app engine

myrpap@gmail.com |

Create an Application

You have 19 applications remaining.

Application Identifier:

cs592hello .appspot.com [Check Availability](#) Yes, "cs592hello" is available!

All Google account names and certain offensive or trademarked names may not be used as Application Identifiers.

You can map this application to your own domain later. [Learn more](#)

Application Title:

Hello Google App Engine

Displayed when users access your application.

Authentication Options (Advanced): [Learn more](#)

Google App Engine provides an API for authenticating your users, including Google Accounts, Google Apps , and OpenID. If you choose to use this feature you'll need to specify now what type of users can sign in to your application:

Open to all Google Accounts users (default)

If your application uses authentication, anyone with a valid Google Account may sign in.

Restricted to the following Google Apps domain

CS-592 Spring 2015 - Myron Papadakis
Transformation Systems Laboratory

Google app engine > create app

The screenshot shows a web browser window with the URL https://appengine.google.com/start/createapp_success?app_id=s~cs592hello. The page title is "Google app engine". The main content is a large bold heading "Application Registered Successfully". Below it, text states: "The application will use **cs592hello** as an identifier. This identifier belongs in [Learn more](#)". It also mentions "The application uses the **High Replication** storage scheme. [Learn more](#)". There is a section titled "Choose an option below:" with three bullet points: "View the [dashboard](#) for Hello Google App Engine.", "Use [appcfg](#) to upload and deploy your application code.", and "Add [administrators](#) to collaborate on this application."

The application will use **cs592hello** as an identifier. This identifier belongs in
[Learn more](#)

The application uses the **High Replication** storage scheme. [Learn more](#)

If you use Google authentication for your application, **Hello Google App En**

Choose an option below:

- View the [dashboard](#) for Hello Google App Engine.
- Use [appcfg](#) to upload and deploy your application code.
- Add [administrators](#) to collaborate on this application.

Google app engine > create app

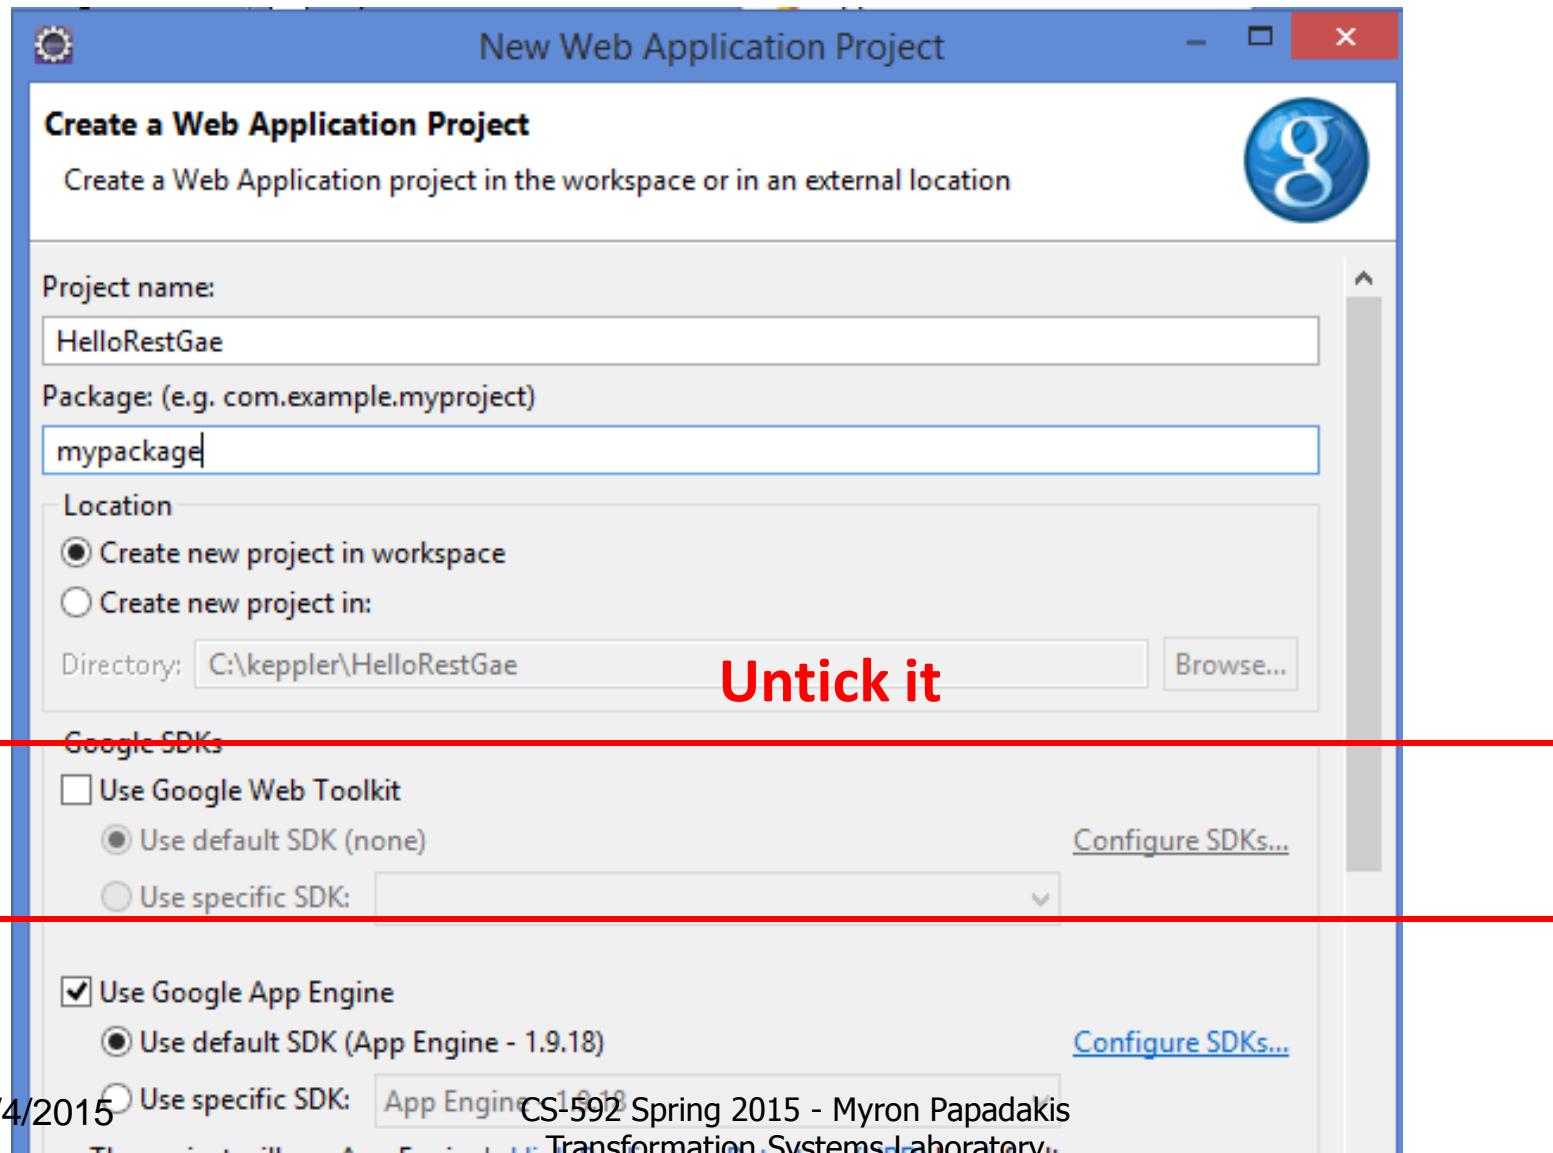

My Applications

My Applications			
App ID	Service	Replication	Status
cs592hello	Hello Google App Engine	High Replication	None Deployed
cs592java	Java Example	High Replication	Running

Google App Engine Project

Google App Engine Project

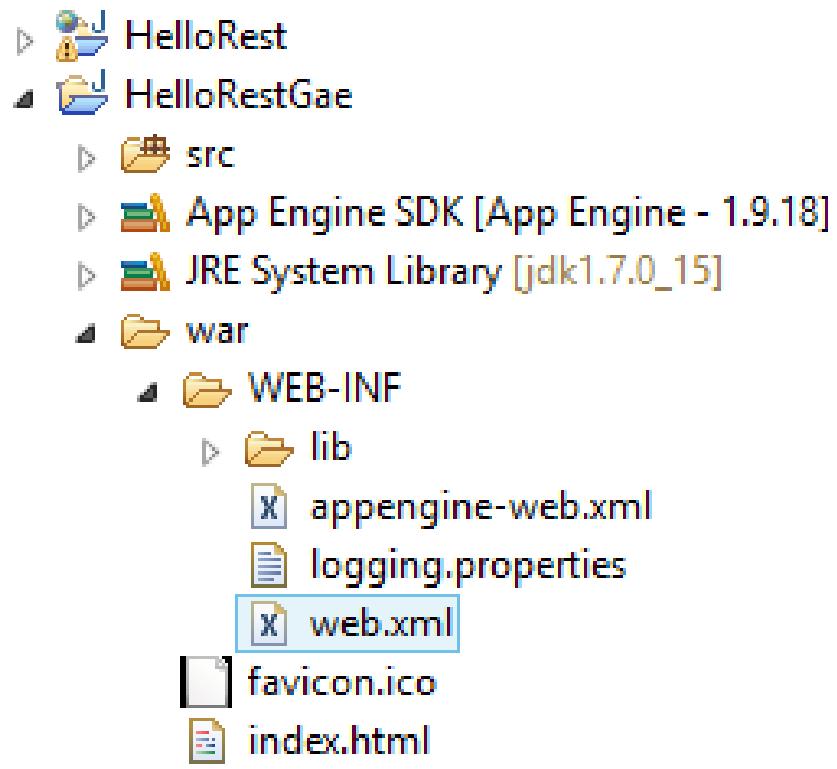

Google App Engine Project > Structure

```
$ tree guestbook/
guestbook/
```

```
├── eclipse-launch-profiles
│   └── DevAppServer.launch
│   └── UpdateApplication.launch
├── nbactions.xml
└── pom.xml
└── README.md

└── main
    ├── java
    └── webapp
        └── WEB-INF
            ├── appengine-web.xml
            ├── logging.properties
            └── web.xml

test
```

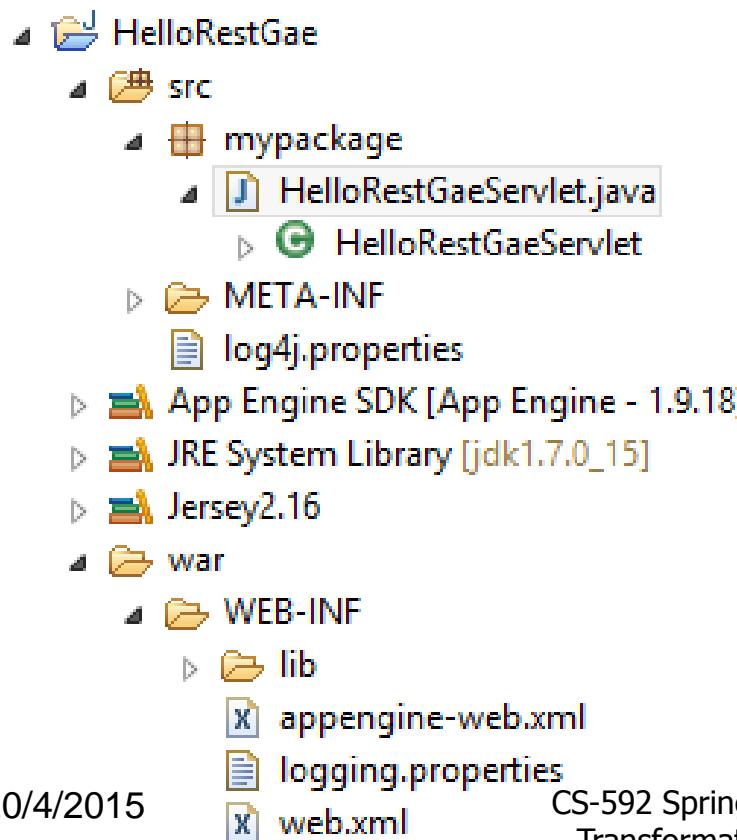

Creating the project

1. You'll add your own application Java classes to
src/main/java/...
2. You'll configure your application using the file
src/main/webapp/WEB-INF/appengine-web.xml
3. You'll configure your application deployment using the file
src/main/webapp/WEB-INF/web.xml

Creating the project > Step1

- So first we will create the resources (actually copy them from the previous project)

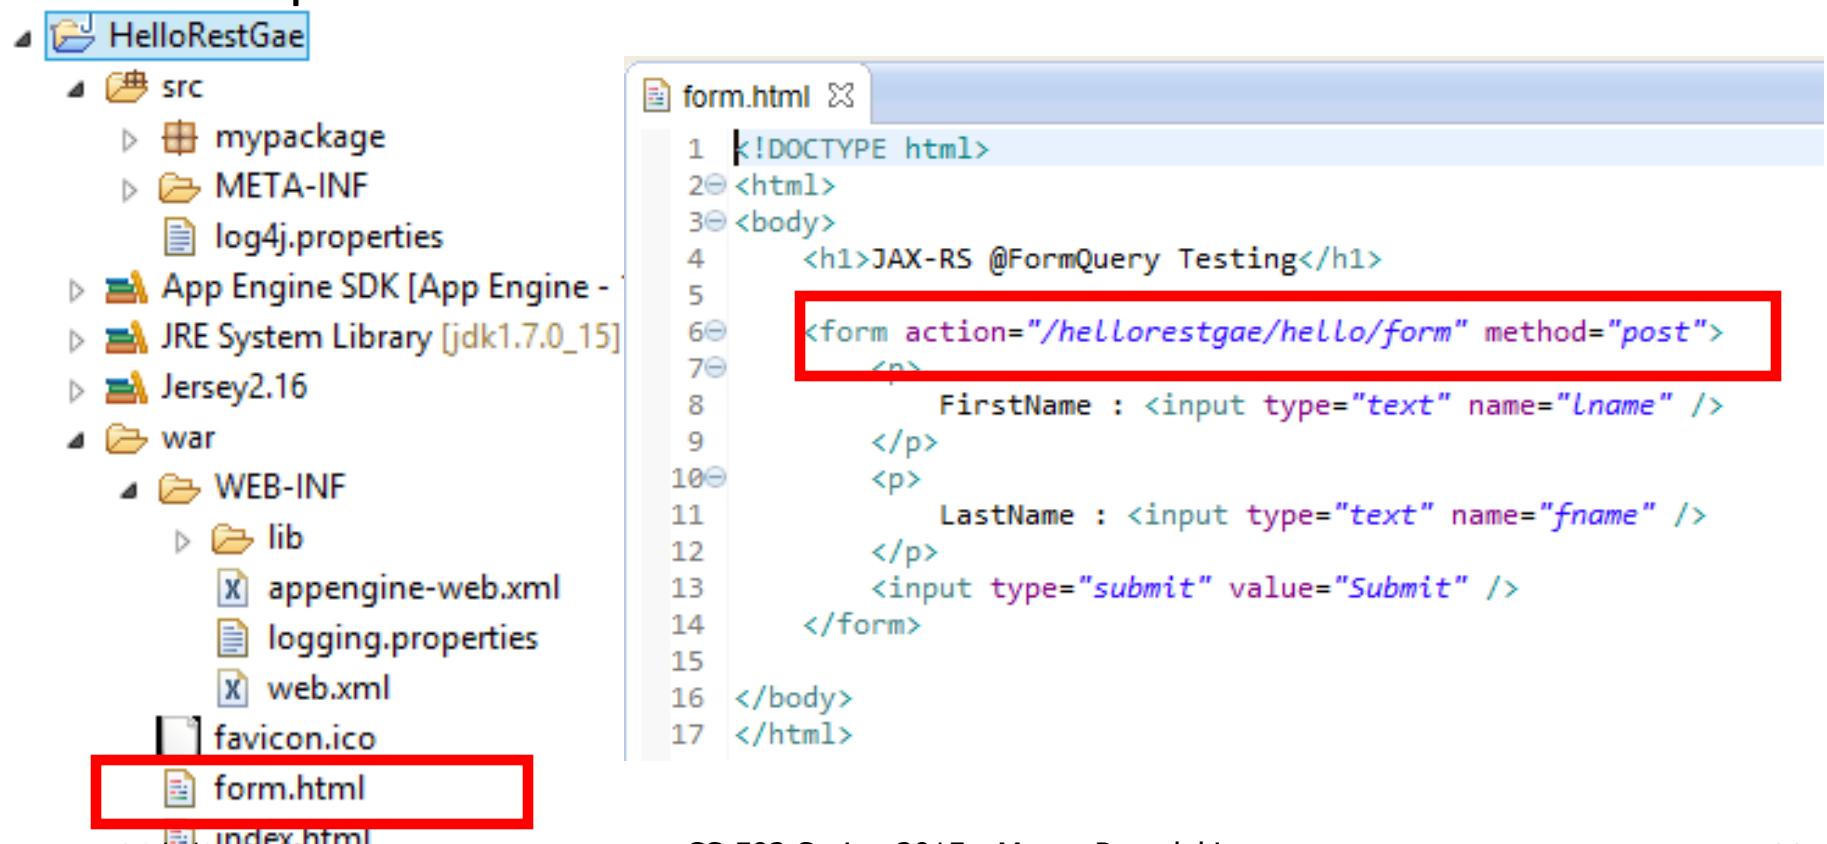

Creating the project > Step1

The screenshot shows a Java code editor with several tabs at the top: web.xml, appengine-web.xml, form.html, HelloRestGaeServlet.java, and HelloResource.java. The HelloResource.java tab is active, displaying the following code:

```
1 package mypackage;
2
3+ import javax.ws.rs.GET;
11 @Path("/hello")
12 public class HelloResource {
13
14
15
16@    @GET
17    @Path("/query")
18    @Produces("text/html")
19    public String getGreetingQueryParam(@QueryParam("name") String name) {
20        return "<html><body><h1>Hello " + name + "</h1></body></html>";
21    }
22
26+    public String getGreetingParam(@PathParam("name") String name) {[]
29
30*
31     * Html File should be located to the WebContent folder
32     */
35+    public Response sayHiToUser([]
44
45 }
```

Creating the project > Step1

- I will also copy the html for the form but I will have to change the path of the action

20/4/2015

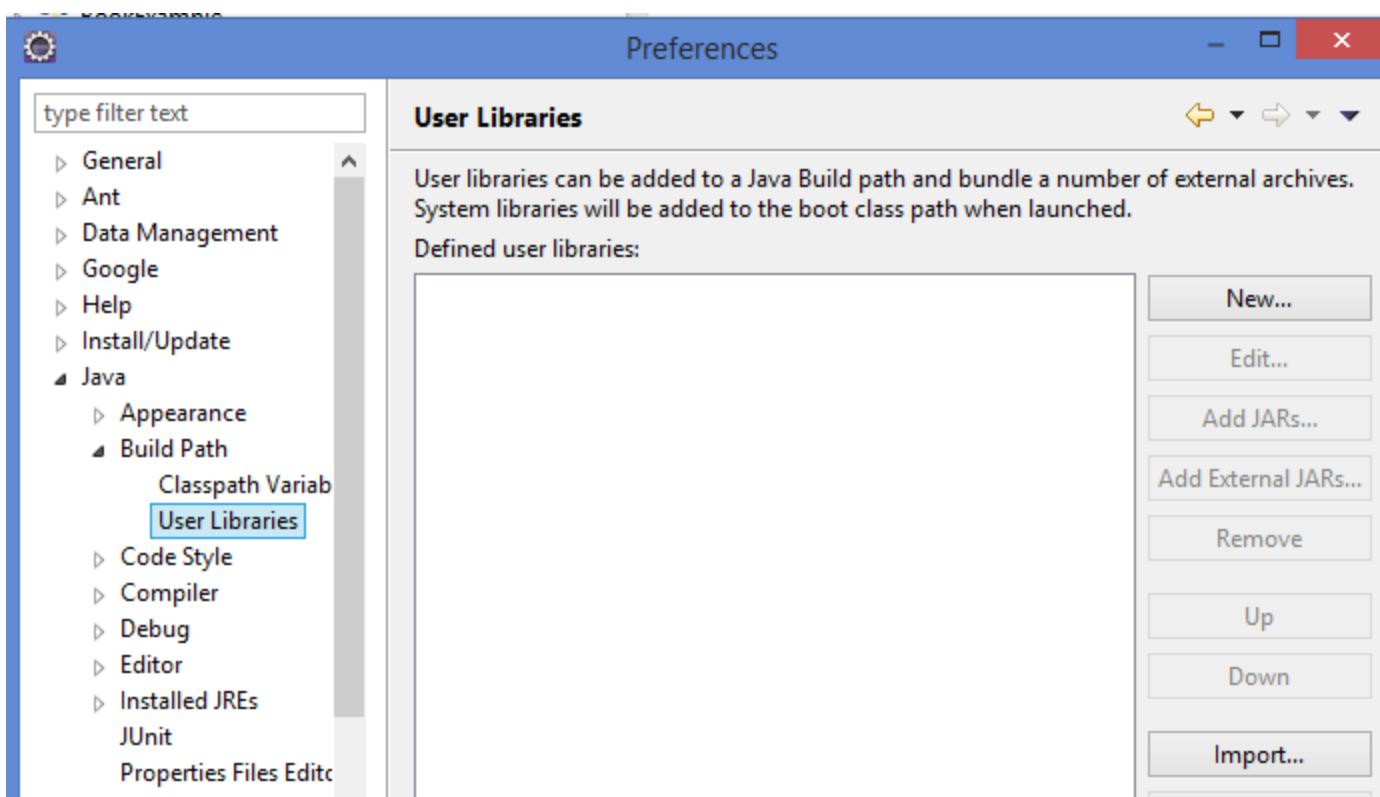

Configuration

- **Configuring the REST support in the application**
 - To be able to create and run REST services in your application you need to:
Add the JAX-RS, JAXB Jars in your project and application
 - Configure the web application (web.xml) to handle REST requests
- **Add JAX-RS, JAXB to your project**

Right click on the project and select menu entry **Build Path > Configure Build Path...**
- Click on the Add External JARs button
- Select all the JARs located in \$JERSEY_HOME/lib and \$JAXB_HOME/lib folders. You can for better visibility and reuse create a user library with all these JARs
- You also need to copy the JARs in the web-inf/lib directory of your application, this step is mandatory to be sure that the JARs are included in the application when deployed to App Engine.

Create a user library for Jersey

- Window > Preferences > Java > Build Path > User Libraries > New > .. Add External Jars > add the jersey jars

type filter text

- ▷ Ant
- ▷ Data Management
- ▷ Google
- ▷ Help
- ▷ Install/Update
- ▲ Java

Library Loaded to build path

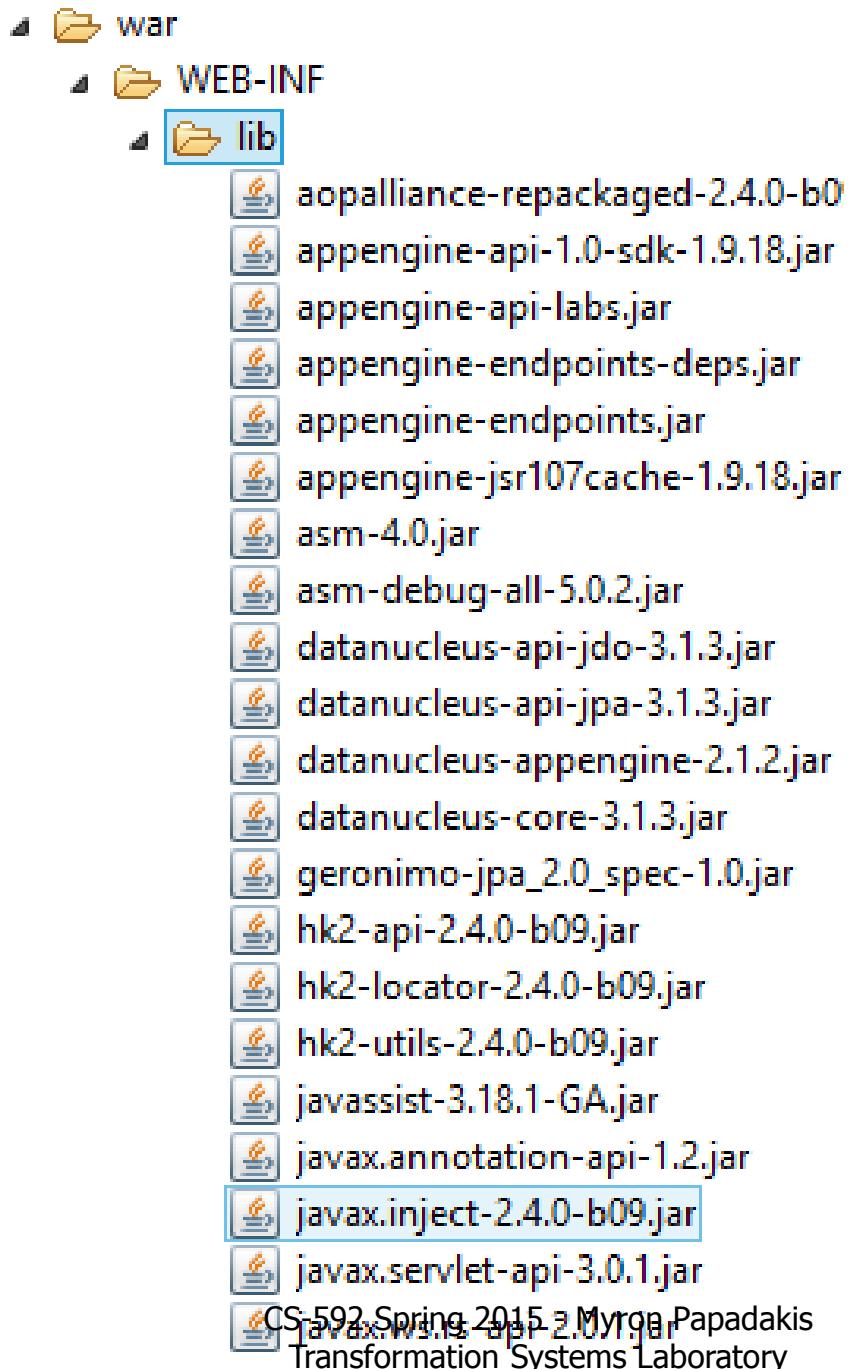

The screenshot shows two open windows in the Eclipse IDE:

- Add Library Dialog:** A modal window titled "Add Library" with a blue header bar. It contains the instruction "Select the library type to add." and a list of library types. The "User Library" option is highlighted with a blue selection bar.
- Properties for HelloRestGae Dialog:** A main window titled "Properties for HelloRestGae" with a blue header bar. It has a toolbar with icons for back, forward, and search. On the left is a sidebar with a "type filter text" input field and a list of Java-related tools and resources. The "Java Build Path" tab is selected in the main content area. The "Libraries" tab is active, showing the "JARs and class folders on the build path:" section which lists three entries: "App Engine SDK [App Engine - 1.9.18]", "JerseyAndJaxb", and "JRE System Library [jdk1.7.0_15]". To the right of the list are three buttons: "Add JARs...", "Add External JARs...", and "Add Variable...".

Configuring the build path

- You must also copy the jars to the lib folder

Configuration > Default generated xml file

```
x web.xml ✎
1 <?xml version="1.0" encoding="utf-8"?>
2 <web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
3   xmlns="http://java.sun.com/xml/ns/javaee"
4   xmlns:web="http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd"
5   xsi:schemaLocation="http://java.sun.com/xml/ns/javaee
6     http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd" version="2.5">
7   <servlet>
8     <servlet-name>HelloRestGae</servlet-name>
9     <servlet-class>mypackage.HelloRestGaeServlet</servlet-class>
10    </servlet>
11    <servlet-mapping>
12      <servlet-name>HelloRestGae</servlet-name>
13      <url-pattern>/hellorestgae</url-pattern>
14    </servlet-mapping>
15    <welcome-file-list>
16      <welcome-file>index.html</welcome-file>
17    </welcome-file-list>
18  </web-app>
19
```

Configuration > Modified web.xml

```
1 <?xml version="1.0" encoding="utf-8"?>
2 <web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
3   xmlns="http://java.sun.com/xml/ns/javaee"
4   xmlns:web="http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd"
5   xsi:schemaLocation="http://java.sun.com/xml/ns/javaee
6   http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd" version="2.5">
7   <servlet>
8     <servlet-name>HelloRestGae</servlet-name>
9     <servlet-class>org.glassfish.jersey.servlet.ServletContainer</servlet-class>
10    <init-param>
11      <param-name>jersey.config.server.provider.packages</param-name>
12      <param-value>mypackage</param-value>
13    </init-param>
14  </servlet>
15  <servlet-mapping>
16    <servlet-name>HelloRestGae</servlet-name>
17    <url-pattern>/hellorestgae/*</url-pattern>
18  </servlet-mapping>
19  <welcome-file-list>
20    <welcome-file>form.html</welcome-file>
21  </welcome-file-list>
22 </web-app>
```

- The configuration parameter jersey.config.server.provider.packages is used by Jersey to list the packages where REST services implementation are located.
- You can put as many package as you need to, you just need to separate the package names by a ;

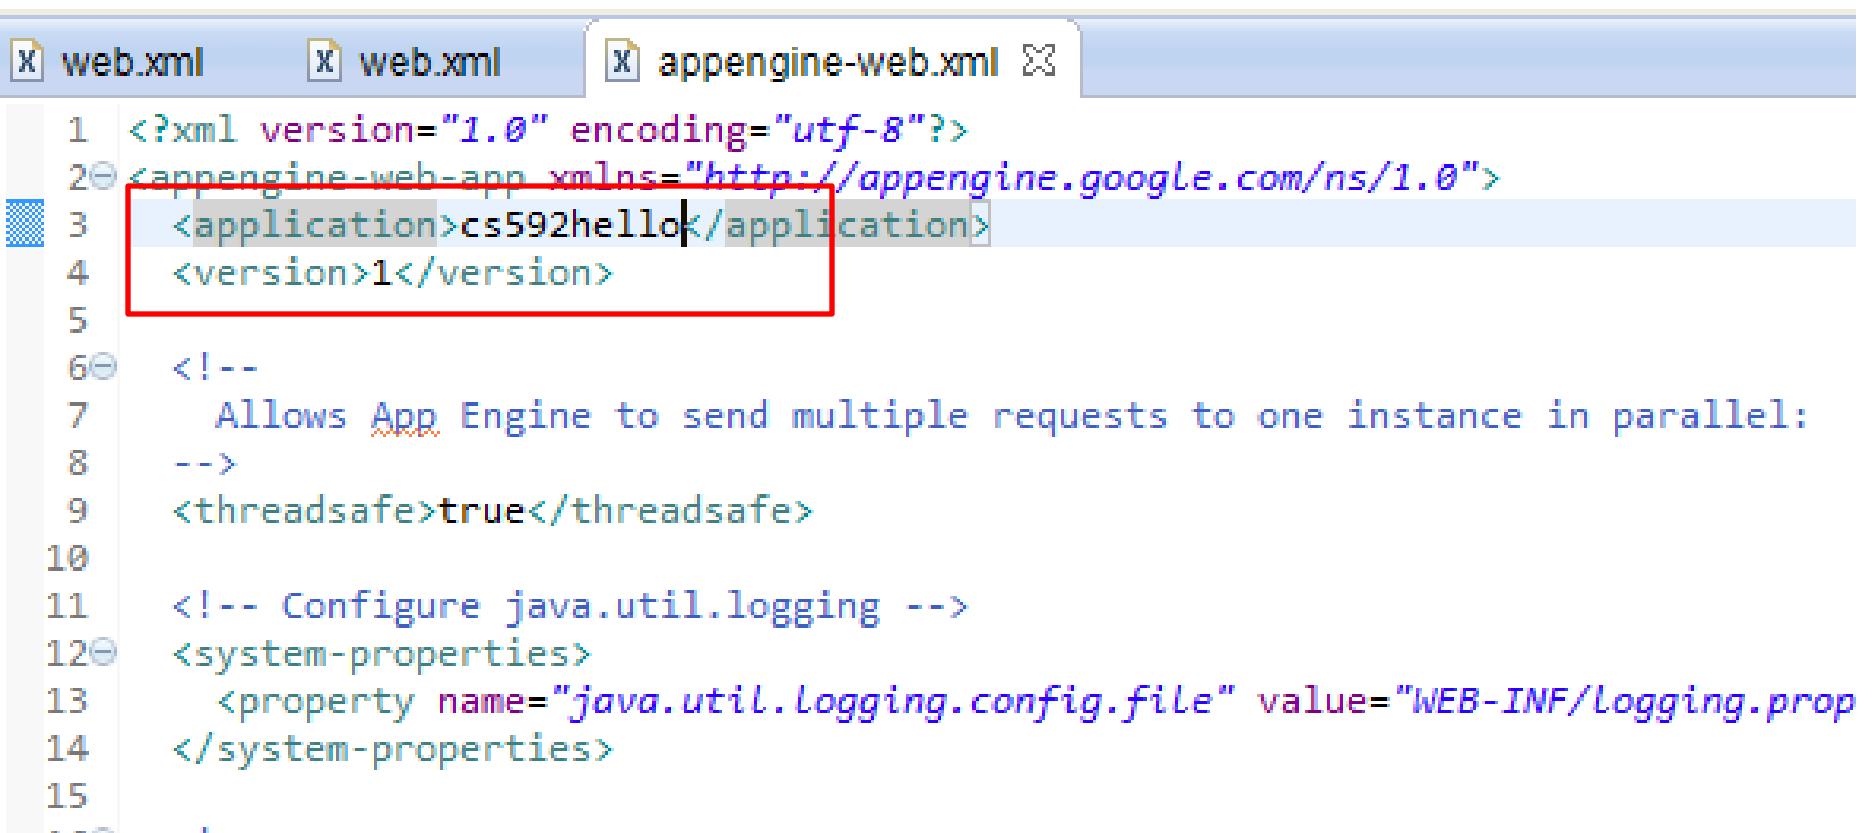

Deploying the application to Google App Engine

- Before deploying the application you need
 - to register a new application in Google App Engine using the Administration Console (see next slide).
 - In my example I have used "cs592hello" as Application ID.
- You can easily now deploy the application to Google App Engine by clicking on the "Deploy App Engine Project" button available in the Eclipse toolbar.
- To be able to deploy your application to Google App Engine, you need to check that your application can be registered, the application ID is stored in the WEB-INF/lib/appengine-web.xml.

Deploying the application to Google App Engine > appengine.web-xml

- Has extra configuration file appengine-web.xml which specifies:
 - Name of application:
 - <application name>.appspot.com
 - Version of application
 - Logging
 - Enabling HTTP Sessions
 - Enabling SSL
 - System properties and environment variables
 - Differentiating between static and resource files
 - By default all files under /war directory are both resource and static files except .JSP and those under /WEB-INF

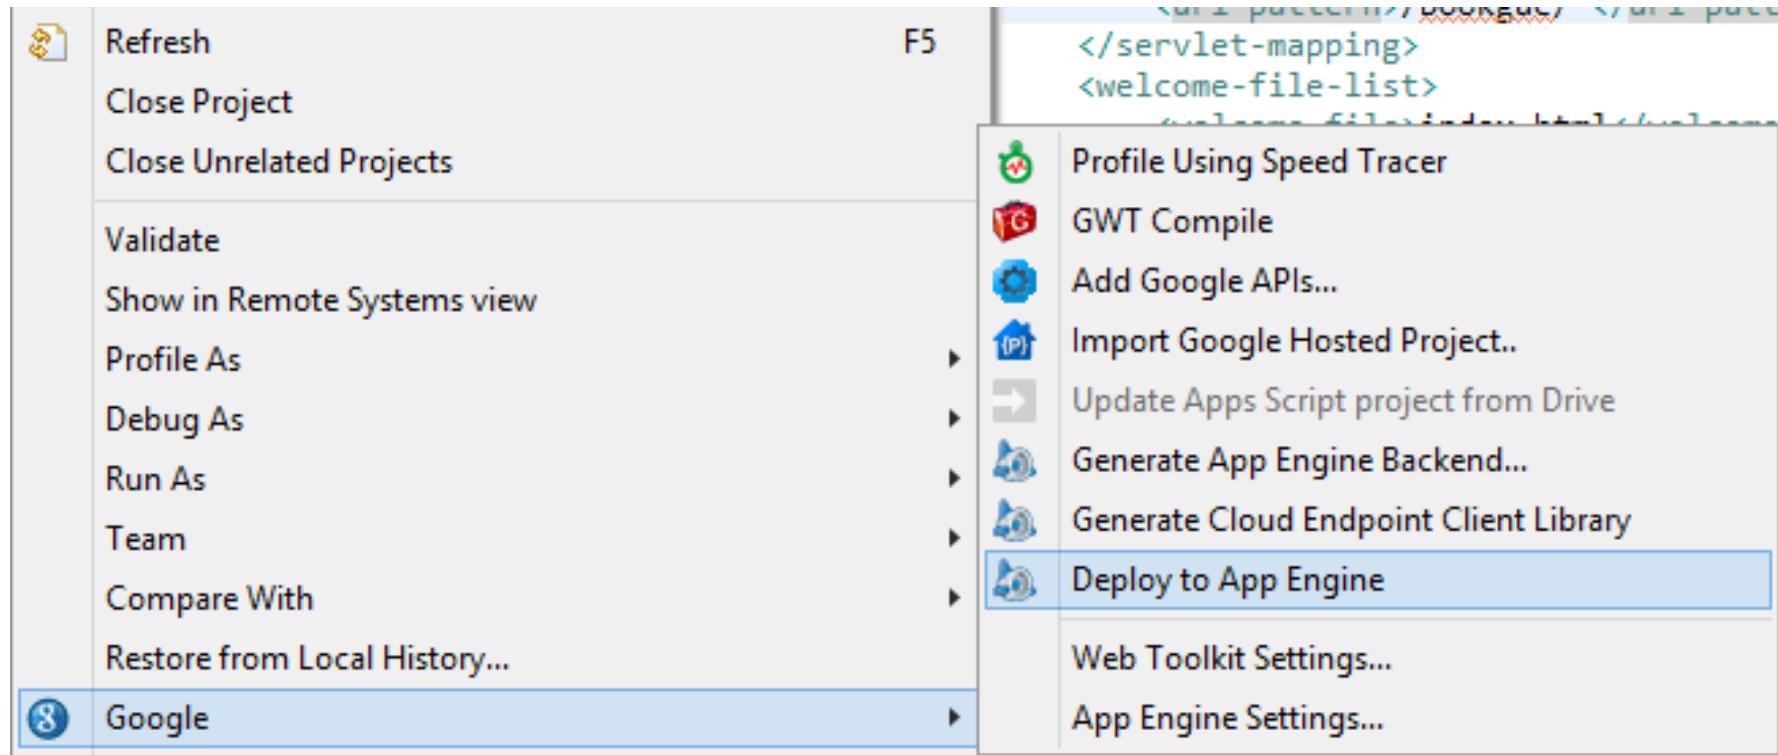

Deploying the application to Google App Engine > appengine.web.xml

```
1 <?xml version="1.0" encoding="utf-8"?>
2 @<appengine-web-app xmlns="http://appengine.google.com/ns/1.0">
3   <application>cs592hello</application>
4   <version>1</version>
5
6 @<!--
7   Allows App Engine to send multiple requests to one instance in parallel:
8   -->
9   <threadsafe>true</threadsafe>
10
11 <!-- Configure java.util.logging -->
12 @<system-properties>
13   <property name="java.util.Logging.config.file" value="WEB-INF/Logging.prop
14 </system-properties>
15
...
```

Deploying the application to Google App Engine

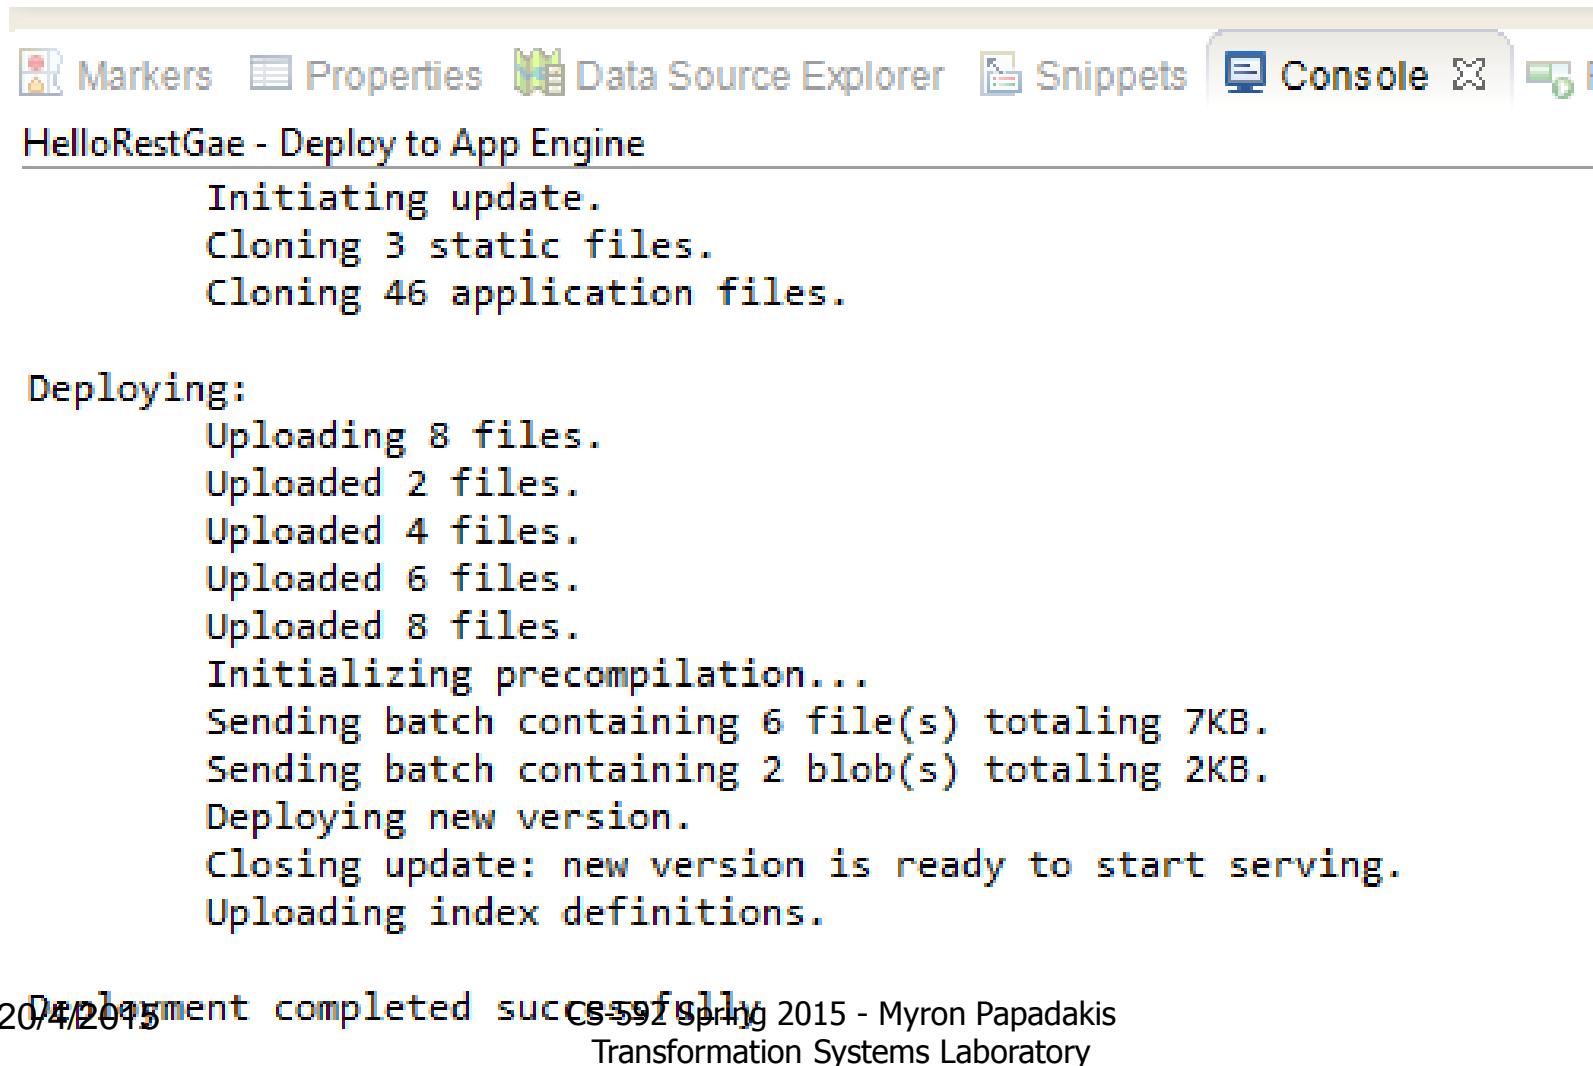

- Right click on the project

Deploying the application to Google App Engine > Credentials

- The App Engine deploy button prompts you for multiple informations:
 - username (your Google account) and password.
- When the deployment is complete you can access your application using the following URL:
[http://\[your-application-id\].appspot.com/url-pattern/resourcepath/methodpath](http://[your-application-id].appspot.com/url-pattern/resourcepath/methodpath)
- <http://cs592hello.appspot.com/hellorestgae/hello/Myron>

Deploying and uploading...

The screenshot shows the Eclipse IDE interface with the 'Console' tab selected. The title bar indicates the project is 'HelloRestGae - Deploy to App Engine'. The console output displays the following log messages:

```
Markers Properties Data Source Explorer Snippets Console
HelloRestGae - Deploy to App Engine
Initiating update.
Cloning 3 static files.
Cloning 46 application files.

Deploying:
Uploading 8 files.
Uploaded 2 files.
Uploaded 4 files.
Uploaded 6 files.
Uploaded 8 files.
Initializing precompilation...
Sending batch containing 6 file(s) totaling 7KB.
Sending batch containing 2 blob(s) totaling 2KB.
Deploying new version.
Closing update: new version is ready to start serving.
Uploading index definitions.

Deployment completed successfully
```

At the bottom left, the date '20/4/2015' is visible. At the bottom right, the text 'CS592 Spring 2015 - Myron Papadakis Transformation Systems Laboratory' is displayed.

GAE success 😊

Hello Myron!

Hello John!

Hello myrpap!

20/4/2015

GAE success 😊

JAX-RS @FormQuery Testing

LastName :

Hello Papadakis Myron!

Book Example

Book Restful Web Service

- Remember the Book Example?
- See Assisting Lecture 7b to recall...
 - We have developed it in Netbeans...
 - Now we will develop it in Eclipse
- We want to deploy this example to the Google App Engine
- No need to modify existing Java code (packages etc)

Book Restful Web Service

- For starters develop a Restful Service that
 - Returns all books
 - Returns a book with a given id
 - Adds a book
- Obviously we will need a structure for the books (list, map or whatever)
- Firstly, the Restful Web Service must create a dummy book
- Each book has
 - Id
 - Name
 - Author
 - Isbn
 - Price

Create a Web Application Project

Create a Web Application project in the workspace or in an external location

Project name:

BookExampleAppEngine

Package: (e.g. com.example.myproject)

gaepackage

Location

- Create new project in workspace
- Create new project in:

Directory: C:\kepler\BookExampleAppEngine

Untick it

[Browse...](#)

Google SDKs

- Use Google Web Toolkit
- Use default SDK (none)
- Use specific SDK:

[Configure SDKs...](#)

Use Google App Engine

- Use default SDK (App Engine - 1.9.18)
- Use specific SDK:

[Configure SDKs...](#)

The project will use App Engine's [High Replication Datastore \(HRD\)](#) by default.

Identifiers for Google App Engine

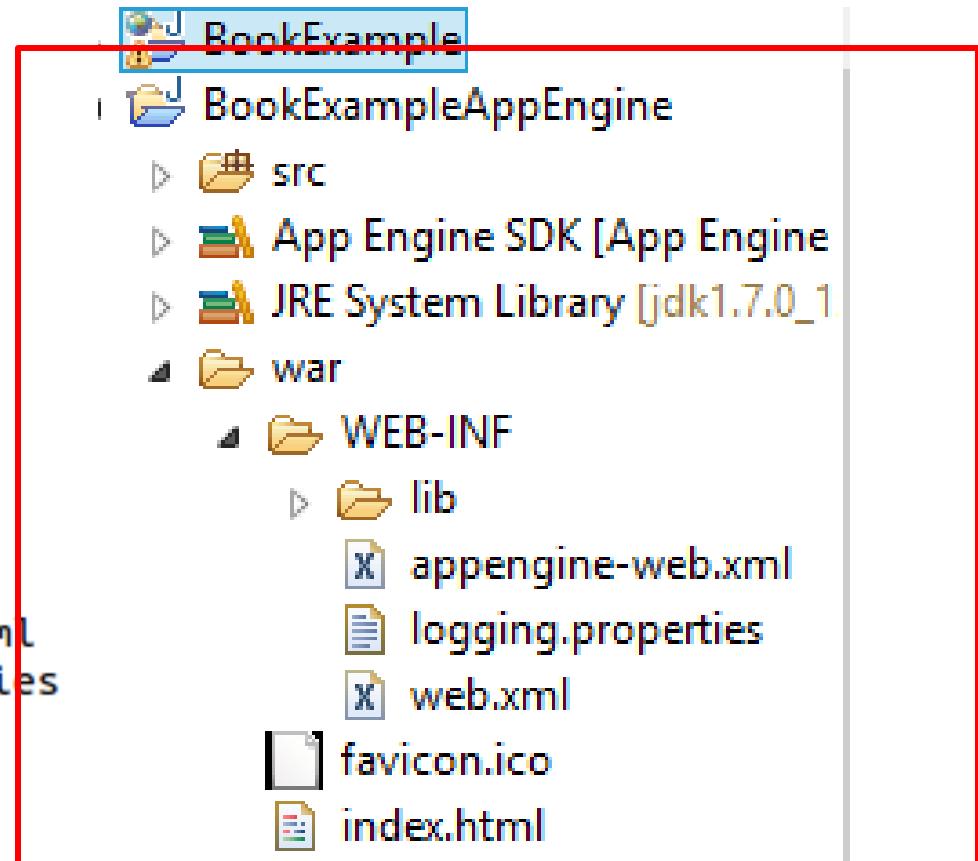

- Leave App Id field blank

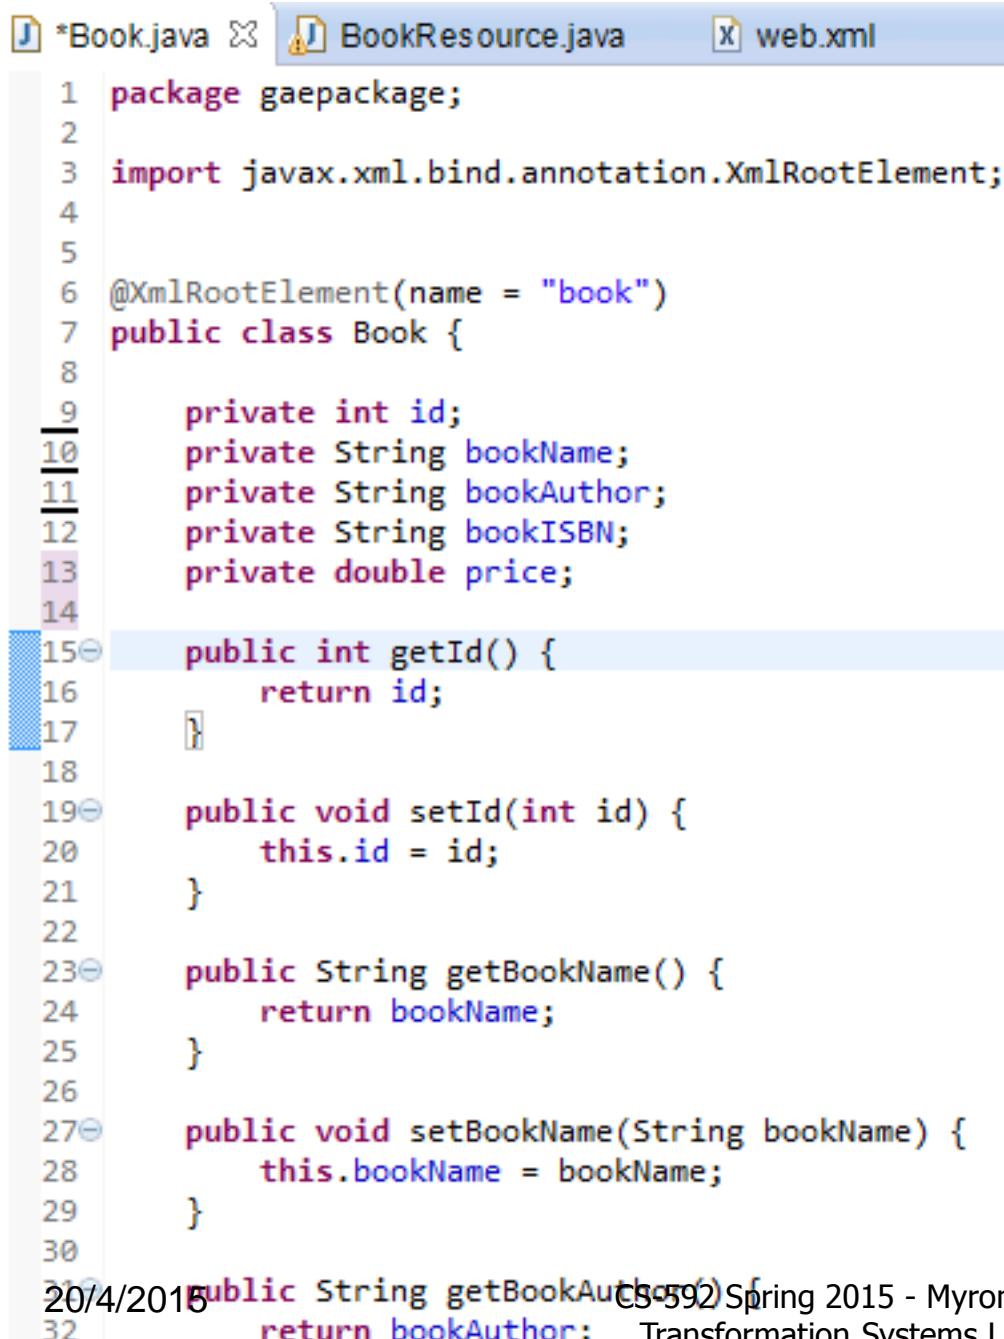

Creating the project

public String updateBook(@PathParam("bookid") int bookid,
    @PathParam("price") double price ) {

```

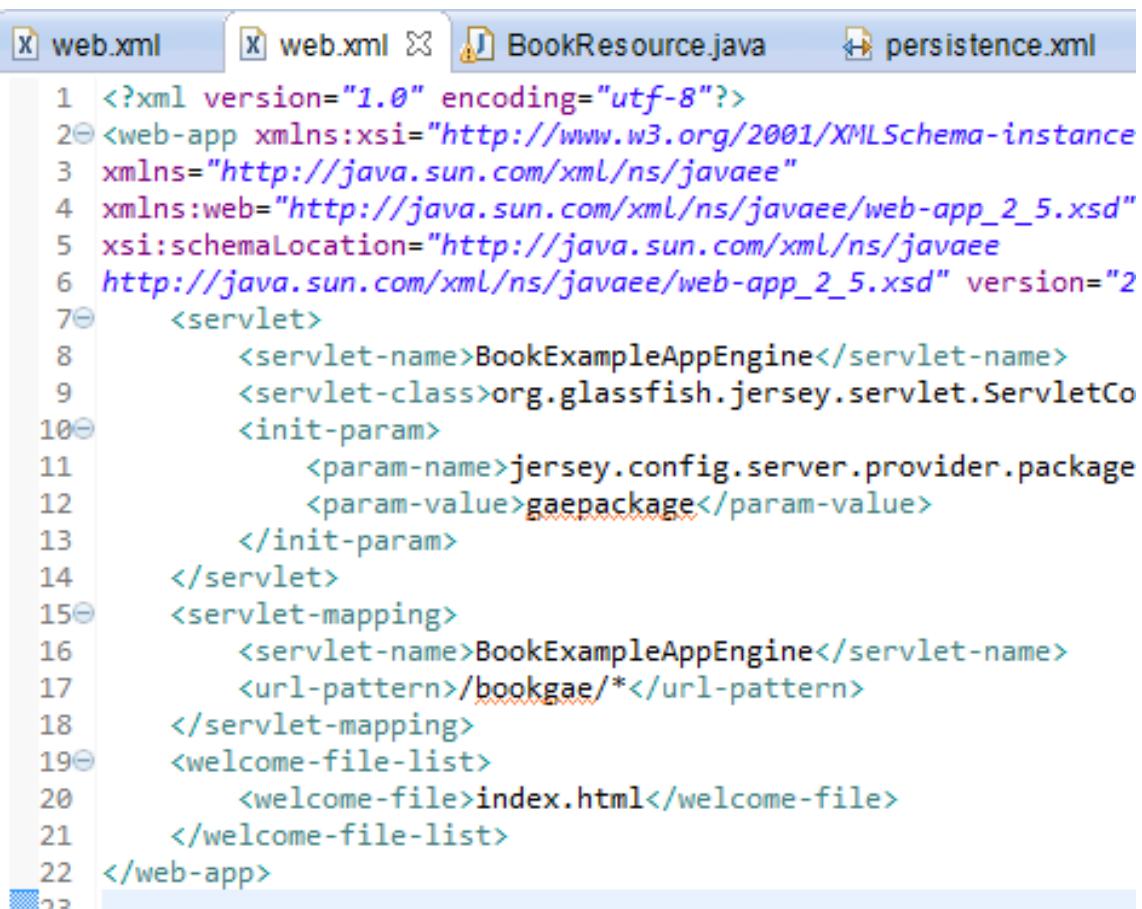

Configuration > Default generated xml file

The screenshot shows a code editor window with the title bar "web.xml". The content is a Java XML configuration file (web.xml) with line numbers 1 through 18. A red rectangular box highlights the entire body of the file, starting from the first servlet definition (line 7) and ending at the closing web-app tag (line 18). The code defines a servlet named "BookExampleAppEngine" with the class "gaepackage.BookExampleAppEngineServlet". It also defines a servlet mapping for the URL pattern "/bookexampleappengine". The welcome-file-list includes "index.html". The XML schema information at the top is also highlighted.

```
1  <?xml version="1.0" encoding="utf-8"?>
2  <web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
3    xmlns="http://java.sun.com/xml/ns/javaee"
4    xmlns:web="http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd"
5    xsi:schemaLocation="http://java.sun.com/xml/ns/javaee
6      http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd" version="2.5">
7    <servlet>
8      <servlet-name>BookExampleAppEngine</servlet-name>
9      <servlet-class>gaepackage.BookExampleAppEngineServlet</servlet-class>
10     </servlet>
11     <servlet-mapping>
12       <servlet-name>BookExampleAppEngine</servlet-name>
13       <url-pattern>/bookexampleappengine</url-pattern>
14     </servlet-mapping>
15     <welcome-file-list>
16       <welcome-file>index.html</welcome-file>
17     </welcome-file-list>
18   </web-app>
```

Configuration > Modified web.xml

```
1  <?xml version="1.0" encoding="utf-8"?>
2  <web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
3    xmlns="http://java.sun.com/xml/ns/javaee"
4    xmlns:web="http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd"
5    xsi:schemaLocation="http://java.sun.com/xml/ns/javaee
6    http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd" version="2
7  <servlet>
8    <servlet-name>BookExampleAppEngine</servlet-name>
9    <servlet-class>org.glassfish.jersey.servlet.ServletCo
10   <init-param>
11     <param-name>jersey.config.server.provider.package
12     <param-value>gaepackage</param-value>
13   </init-param>
14 </servlet>
15 <servlet-mapping>
16   <servlet-name>BookExampleAppEngine</servlet-name>
17   <url-pattern>/bookgae/*</url-pattern>
18 </servlet-mapping>
19 <welcome-file-list>
20   <welcome-file>index.html</welcome-file>
21 </welcome-file-list>
22 </web-app>
```

- This servlet that will answer all request the /bookgae/* URL and redirect them to classes representing RESTfull services
- The configuration parameter com.sun.jersey.config.property.packages is used by Jersey to list the packages where REST services implementation are located.
- You can put as many package as you need to, you just need to separate the package names by a ;
- You do not need the welcome file too (since you will not use a servlet)

Optional (If you want to use servlets)

```
<servlet>
    <servlet-name>BookExampleAppEngineServlet</servlet-name>
    <servlet-class>gaepackage.BookExampleAppEngineServlet</servlet-class>
</servlet>
<servlet-mapping>
    <servlet-name>BookExampleAppEngineServlet</servlet-name>
    <url-pattern>/BookExampleAppEngineServlet</url-pattern>
</servlet-mapping>
<!-- but -->
<html>
  <head>
    <meta http-equiv="content-type" content="text/html; charset=UTF-8">
    <title>Hello App Engine</title>
  </head>

  <body>
    <h1>Hello App Engine!</h1>

    <table>
      <tr>
        <td colspan="2" style="font-weight:bold;">Available Servlets:</td>
      </tr>
      <tr>
        <td><a href="BookExampleAppEngineServlet">BookExampleAppEngine</a></td>
      </tr>
    </table>
  </body>
</html>
```

Deploying the application to Google App Engine

- Before deploying the application you need
 - to register a new application in Google App Engine using the Administration Console (see next slide).
 - In my example I have used “**cs592book**” as Application ID.
- You can easily now deploy the application to Google App Engine by clicking on the “Deploy App Engine Project” button available in the Eclipse toolbar.
- To be able to deploy your application to Google App Engine, you need to check that your application can be registered, **the application ID is stored in the WEB-INF/lib/appengine-web.xml**.

Deploying the application to Google App Engine > appengine.web.xml

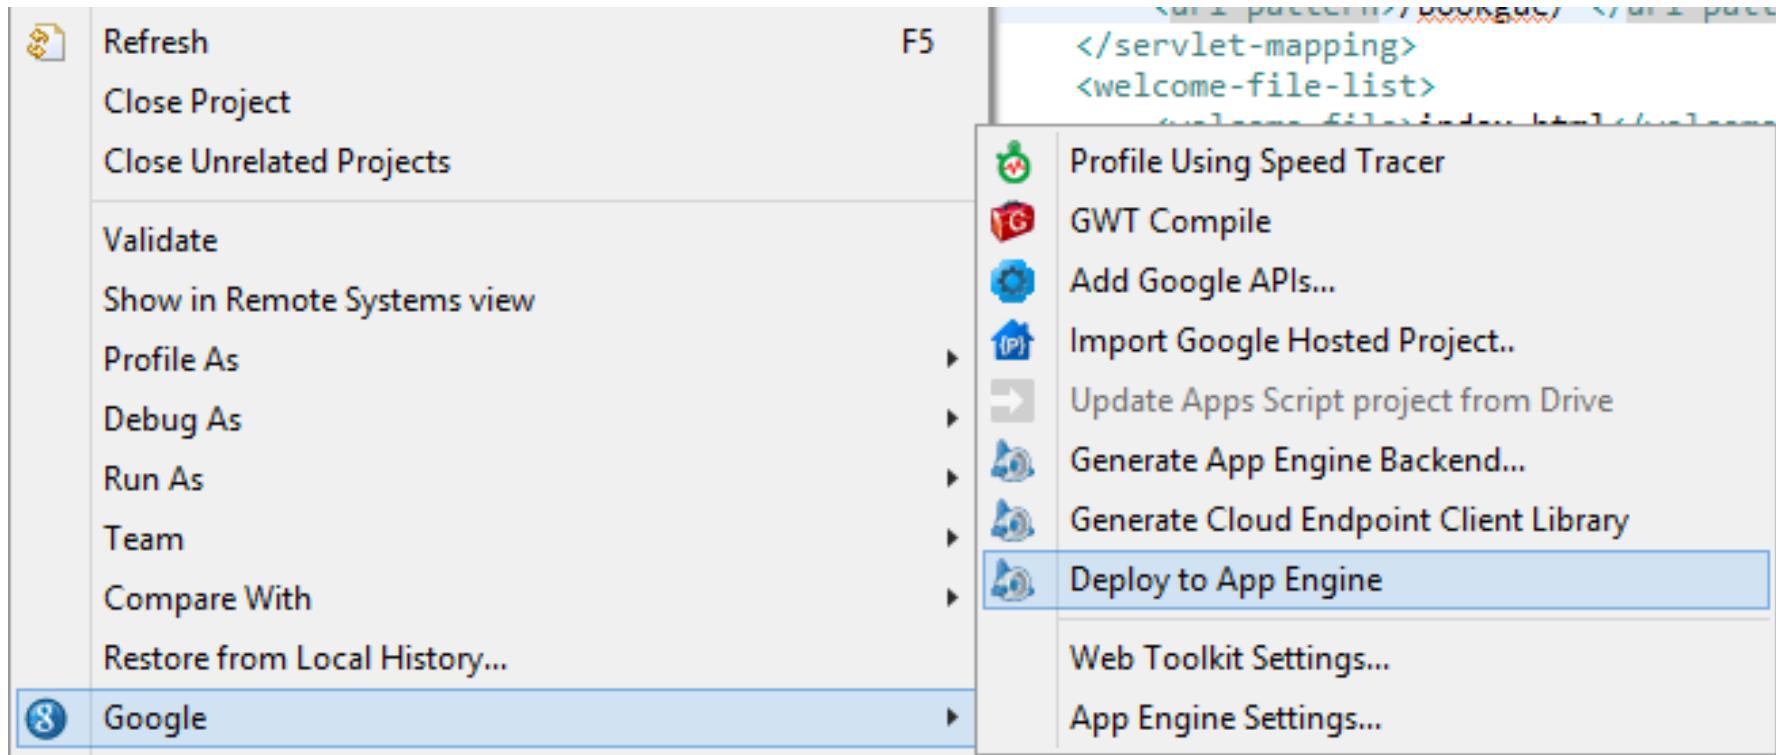

The screenshot shows a code editor with several tabs at the top: main.js, Tomcat v7.0..., web.xml, BookResource..., appengine-web.xml, and a help icon. The appengine-web.xml tab is active. The code in the editor is as follows:

```
1  <?xml version="1.0" encoding="utf-8"?>
2  <appengine-web-app xmlns="http://appengine.google.com/ns/1.0">
3      <application>cs592book</application>
4      <version>1</version>
5
6      <!--
7          Allows App Engine to send multiple requests to one instance in parallel:
8          -->
9      <threadsafe>true</threadsafe>
10
11     <!-- Configure java.util.logging -->
12     <system-properties>
13         <property name="java.util.logging.config.file" value="WEB-INF/Logging.properties"/>
14     </system-properties>
15
16     <!--
17         HTTP Sessions are disabled by default. To enable HTTP sessions specify:
18
19             <sessions-enabled>true</sessions-enabled>
20
21         It's possible to reduce request latency by configuring your application to
22         asynchronously write HTTP session data to the datastore:
23
24             <async-session-persistence enabled="true" />
25
```

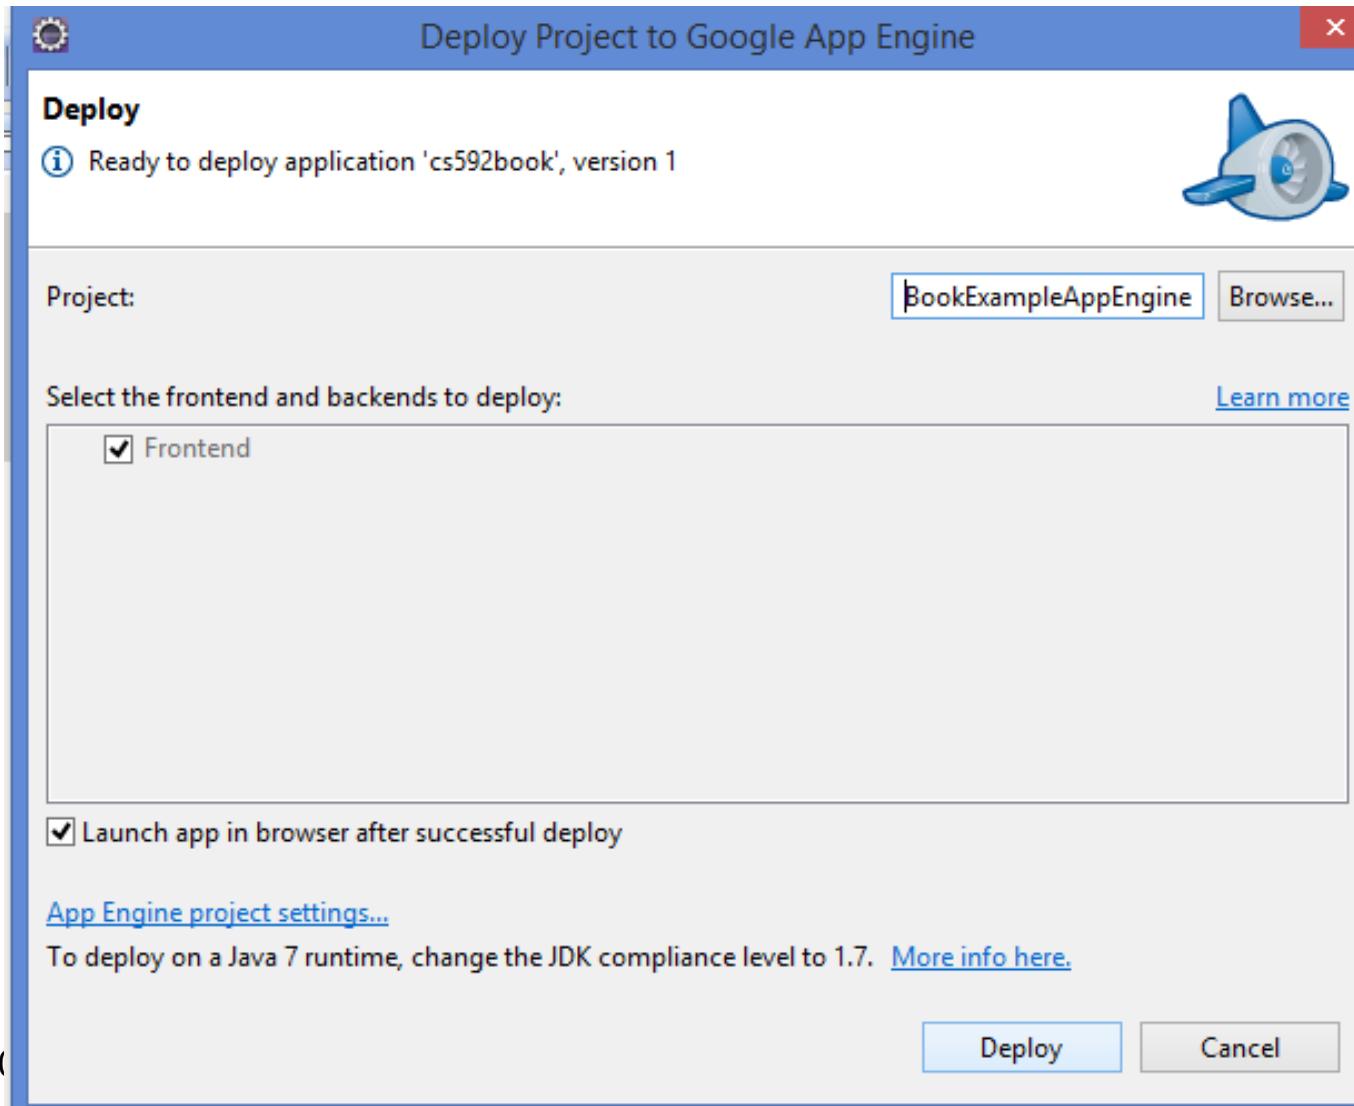

A red box highlights the application and version tags in line 3 and 4.

Deploying the application to Google App Engine

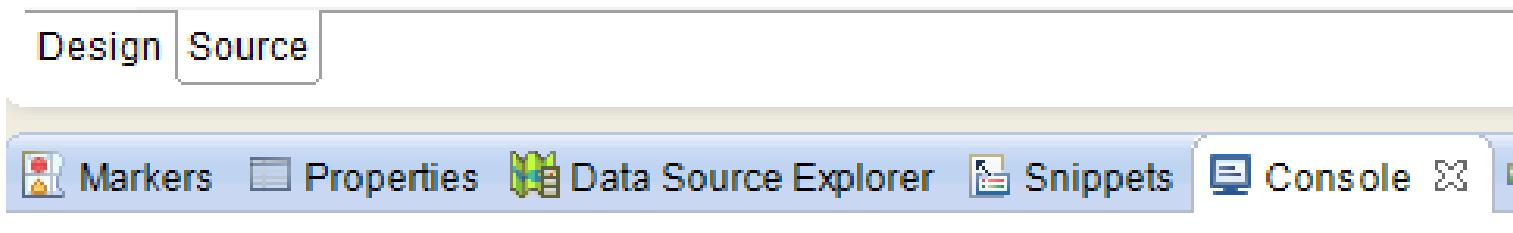

- Right click on the project

Deploying the application to Google App Engine

Deploying the application to Google App Engine > Uploading

Deploying:

```
Uploading 1 files.  
Uploaded 1 files.  
Initializing precompilation...

Uploading index definitions.
```

Google App Engine > Create Application

25 Applications for free ☺

The screenshot shows the 'Create an Application' page of the Google App Engine web interface. At the top, there's a navigation bar with a back arrow, a lock icon, the URL <https://appengine.google.com/start/createapp>, a refresh button, a search bar with the placeholder 'Search', and a forward arrow.

The main header is 'Google app engine' with a logo, and the user information 'myrpap@gmail.com | My Account | Help | Sign out'.

Create an Application

You have 19 applications remaining.

Application Identifier: .appspot.com

All Google account names and certain offensive or trademarked names may not be used as Application Identifiers.

You can map this application to your own domain later. [Learn more](#)

Application Title:

Displayed when users access your application.

Authentication Options (Advanced): [Learn more](#)

Google App Engine provides an API for authenticating your users, including Google Accounts, Google Apps, and OpenID. If you choose to use this feature for some parts of your site, you'll need to specify now what type of users can sign in to your application:

Open to all Google Accounts users (default)
If your application uses authentication, anyone with a valid Google Account may sign in.

Restricted to the following Google Apps domain:

Deploying the application to Google App Engine > Credentials

- The App Engine deploy button prompts you for multiple informations:
 - username (your Google account) and password.
- When the deployment is complete you can access your application using the following URL:
[http://\[your-application-id\].appspot.com/url-pattern/resourcepath/methodpath](http://[your-application-id].appspot.com/url-pattern/resourcepath/methodpath)
- <http://cs592book.appspot.com/bookgae/bookresource/books>

Αυτό το αρχείο XML δεν φαίνεται να έχει συσχετισμένες πληροφορίες μορφοποίησης. Το δένδρο εγγράφου φαίνεται παρακάτω.

```
- <books>
  - <book>
    <bookAuthor>Test Author</bookAuthor>
    <bookISBN>ISBN 10: 0-596-52926-1</bookISBN>
    <bookName>RESTful Web Services</bookName>
    <id>1</id>
    <price>0.0</price>
  </book>
</books>
```

Google Gson

JSON

- Gson is a Java library that can be used
 - to convert Java Objects into their JSON representation.
 - It can also be used to convert a JSON string to an equivalent Java object.

<https://code.google.com/p/google-gson/>

<http://www.studytrails.com/java/json/java-google-json-introduction.jsp>

Gson Example (for Book)

```
1 package gson;
2
3 import com.google.gson.Gson;
4 import gaepackage.Book;
5
6 public class GSONDemo {
7
8     public static void convertJavaToJSON(){
9         Book book = new Book();
10        book.setBookAuthor("Bhaveh Thaker");
11        book.setBookName("Introduction to RESTful Web Services");
12        book.setBookISBN("ISBN 10: 0-596-52926-0");
13        Gson gson = new Gson();
14        System.out.println(gson.toJson(book));
15    }
16    public static void convertJSONtoJava(){
17        Gson gson = new Gson();
18
19        System.out.println(
20            gson.fromJson("{\"id\":1,'bookName':'RESTful Java Web Services','bookAuth
21            Book.class"));
22    }
}
```

Gson Example (for Book)

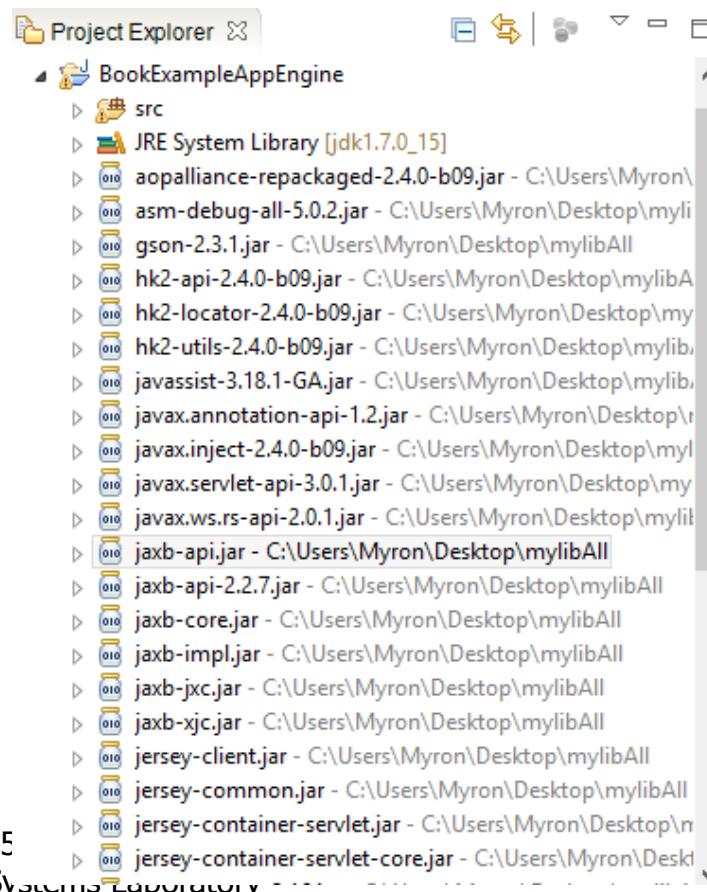

```
23 ⊞ public static void main(String[] args) {  
24     convertJavaToJSON();  
25     convertJSONToJava();
```

The screenshot shows an IDE interface with several tabs at the top: Markers, Properties, Data Source Explorer, Snippets, Console, Progress, Remote Systems, and Help. The 'Console' tab is active, displaying the output of a Java application named 'GSONDemo'. The output shows the JSON representation of a book object:

```
<terminated> GSONDemo [Java Application] C:\Program Files\Java\jdk1.7.0_15\bin\javaw.exe (18 Απρ 2015 - 10:51:33 π.μ.)  
{"id":0,"bookName":"Introduction to RESTful Web Services","bookAuthor":"Bhaveh Thaker","bookISBN":"IS  
Book [id=1, bookName=RESTful Java Web Services, bookAuthor=bookISBN, bookISBN=1847196462, price=50.0]
```

Add Gson Code

- Right click on project->Property->java build path->Add jars and then go to src->jars->gson-2.3.1.jar.

BookExample with GSON > get all books

```
private TreeMap<Integer, Book> bookMap = new TreeMap<Integer, Book>();  
  
public BookResource() {  
    Book book = new Book();  
    book.setBookAuthor("Bhaveh Thaker");  
    book.setBookName("Introduction to RESTful Web Services");  
    book.setBookISBN("ISBN 10: 0-596-52926-0");  
    addBook(book);  
  
}  
  
@GET  
@Path("books")  
@Produces(MediaType.APPLICATION_JSON)  
public String getBooks() {  
    List<Book> books = new ArrayList<Book>();  
    books.addAll(bookMap.values());  
    Gson gson = new Gson();  
    String jsonArray = gson.toJson(books);  
    return jsonArray;  
}
```

BookExample with GSON > get all books

- Returned in JSON format

The screenshot shows a request-response interface. The REQUEST section has a URL of <http://cs592book.appspot.com/bookgae/bookresource/books>, a method of GET selected, and a "GET" button highlighted. The RESPONSE section shows the result of the GET request on the same URL. The status is 200 OK. The response is displayed in Browser mode, Pretty format, and shows the following JSON array:

```
[{"id":0,"bookName":"Introduction to RESTful Web Services","bookAuthor":"Bhaveh Thaker","bookISBN":"ISBN 10: 0-596-52926-0","price":0.0}]
```

BookExample with GSON > get a book

```
@GET  
@Path("{id}")  
public String getBook(@PathParam("id") int bookId) {  
    Gson gson = new Gson();  
    String jsonArray = gson.toJson(bookMap.get(bookId));  
    return jsonArray;  
}
```

The screenshot shows the HttpRequester tool interface. The REQUEST tab is active, displaying a URL input field with the value "http://cs592book.appspot.com/bookgae/bookresource/0". Below the URL are several buttons: "GET" (highlighted in blue), "POST", and "PUT". There are also "New request" and "Paste Request" buttons. The RESPONSE tab is below, showing the results of a GET request. The status is "Status: 200 OK". The response body is a JSON object: {"id":0,"bookName":"Introduction to RESTful Web Services","bookAuthor":"Bhaveh Thaker","bookISBN":"ISBN 10: 0-596-52926-0","price":0.0}.
